SeedStar™ 2 and SeedStar™ XP Monitor for Planters

OPERATOR'S MANUAL

SeedStar™ 2 and SeedStar™ XP Monitor for Planters

OMA102656 ISSUE J4 (ENGLISH)

CALIFORNIA

Proposition 65 Warning

Diesel engine exhaust and some of its constituents
are known to the State of California to cause cancer,
birth defects, and other reproductive harm.

If this product contains a gasoline engine:

⚠ WARNING

The engine exhaust from this product contains
chemicals known to the State of California to cause
cancer, birth defects or other reproductive harm.

The State of California requires the above two warnings.

Additional Proposition 65 Warnings can be found in this manual.

John Deere Seeding Group
North American Edition

Introduction

Foreword

READ THIS MANUAL carefully to avoid personal injury or equipment damage. Learn how to operate and service the machine correctly. If desired, see your John Deere dealer to determine if this manual and safety signs on the machine are available in other languages.

CONSIDER THIS MANUAL a permanent part of the machine and include the manuals with the machine when sold.

MEASUREMENTS in this manual are given in both metric and customary U.S. unit equivalents. Use only correct replacement parts and fasteners. Metric and inch fasteners require a specific metric or inch wrench.

RIGHT-HAND AND LEFT-HAND sides are determined by facing the direction the implement travels when moving forward.

WRITE PRODUCT IDENTIFICATION NUMBERS (P.I.N.) in the Specification section. Accurately record all the numbers to help trace the machine if stolen. Your dealer also needs these numbers to order parts. File the identification numbers in a secure place away from machine.

Safety

Recognize Safety Information

This is a safety-alert symbol. When you see this symbol on your machine or in this manual, be alert to the potential for personal injury.

Follow recommended precautions and safe operating practices.

DX,ALERT -19-29SEP98-1/1

T81389 —UN—28JUN13

Understand Signal Words

A signal word—DANGER, WARNING, or CAUTION—is used with the safety-alert symbol. DANGER identifies the most serious hazards.

DANGER or WARNING safety signs are located near specific hazards. General precautions are listed on CAUTION safety signs. CAUTION also calls attention to safety messages in this manual.

⚠ DANGER

⚠ WARNING

⚠ CAUTION

DX,SIGNAL -19-03MAR93-1/1

TS187 —19—30SEP88

Follow Safety Instructions

Carefully read all safety messages in this manual and on your machine safety signs. Keep safety signs in good condition. Replace missing or damaged safety signs. Be sure new equipment components and repair parts include the current safety signs. Replacement safety signs are available from your John Deere dealer.

There can be additional safety information contained on parts and components sourced from suppliers that is not reproduced in this operator's manual.

Learn how to operate the machine and how to use controls properly. Do not let anyone operate without instruction.

Keep your machine in proper working condition. Unauthorized modifications to the machine may impair the function and/or safety and affect machine life.

If you do not understand any part of this manual and need assistance, contact your John Deere dealer.

DX,READ -19-16JUN09-1/1

TS201 —UN—15APR13

Replace Safety Signs

Replace missing or damaged safety signs. Use this operator's manual for correct safety sign placement.

There can be additional safety information contained on parts and components sourced from suppliers that is not reproduced in this operator's manual.

TS201 —UN—15APR13

DX,SIGNS -19-18AUG09-1/1

Prevent Machine Runaway

Avoid possible injury or death from machinery runaway.

Do not start engine by shorting across starter terminals. Machine will start in gear if normal circuitry is bypassed.

NEVER start engine while standing on ground. Start engine only from operator's seat, with transmission in neutral or park.

TS177 —UN—11JAN89

DX,BYPAS1 -19-29SEP98-1/1

Avoid High-Pressure Fluids

Inspect hydraulic hoses periodically – at least once per year – for leakage, kinking, cuts, cracks, abrasion, blisters, corrosion, exposed wire braid or any other signs of wear or damage.

Replace worn or damaged hose assemblies immediately with John Deere approved replacement parts.

Escaping fluid under pressure can penetrate the skin causing serious injury.

Avoid the hazard by relieving pressure before disconnecting hydraulic or other lines. Tighten all connections before applying pressure.

Search for leaks with a piece of cardboard. Protect hands and body from high-pressure fluids.

If an accident occurs, see a doctor immediately. Any fluid injected into the skin must be surgically removed within a few hours or gangrene may result. Doctors unfamiliar

X9811 —UN—23AUG88

with this type of injury should reference a knowledgeable medical source. Such information is available in English from Deere & Company Medical Department in Moline, Illinois, U.S.A., by calling 1-800-822-8262 or +1 309-748-5636.

DX,FLUID -19-12OCT11-1/1

Prevent Battery Explosions

Keep sparks, lighted matches, and open flame away from the top of battery. Battery gas can explode.

Never check battery charge by placing a metal object across the posts. Use a volt-meter or hydrometer.

Do not charge a frozen battery; it may explode. Warm battery to 16°C (60°F).

DX,SPARKS -19-03MAR93-1/1

TS204 —UN—15APR13

Welding Near Electronic Control Units

IMPORTANT: Do not jump-start engines with arc welding equipment. Currents and voltages are too high and may cause permanent damage.

1. Disconnect the negative (-) battery cable(s).
2. Disconnect the positive (+) battery cable(s).
3. Connect the positive and negative cables together. Do not attach to vehicle frame.
4. Clear or move any wiring harness sections away from welding area.
5. Connect welder ground close to welding point and away from control units.

6. After welding, reverse Steps 1—5.

DX,WW,ECU02 -19-14AUG09-1/1

TS953 —UN—15MAY90

Keep Electronic Control Unit Connectors Clean

IMPORTANT: Do not open control unit and do not clean with a high-pressure spray. Moisture, dirt, and other contaminants may cause permanent damage.

1. Keep terminals clean and free of foreign debris. Moisture, dirt, and other contaminants may cause the terminals to erode over time and not make a good electrical connection.

2. If a connector is not in use, put on the proper dust cap or an appropriate seal to protect it from foreign debris and moisture.
3. Control units are not repairable.
4. Since control units are the components LEAST likely to fail, isolate failure before replacing by completing a diagnostic procedure. (See your John Deere dealer.)
5. The wiring harness terminals and connectors for electronic control units are repairable.

DX,WW,ECU04 -19-11JUN09-1/1

Monitor Power Up and Power Down

Upon power up, wait for display to detect data from implement control unit and adjust screens before working with display.

If the last programmed home page is for an implement not currently connected to tractor, the monitor defaults to Layout Manager screen.

IMPORTANT: Avoid data loss. Do not cycle power quickly. Wait 30 seconds after power down before data card is removed or before another power up.

If power is cycled too quickly data loss is possible. Upon power down, wait for power light on monitor to go out and wait an additional 30 seconds before another power up.

OUO6074,0000FA4 -19-24OCT08-1/1

Virtual Terminal Displays

When using only the John Deere Tractor CommandCenter™ to display planter monitor:

1. Turn on key power and allow the application to load. Select Main menu, then select Display (button I).
2. Select Settings button (button J), then select the Multiple Displays button (button H)
3. On the multiple displays setup page, check the box next to "Implement Bus Virtual Terminal" to allow the CommandCenter to communicate on the Implement Bus.
4. Once this box is checked, turn off key power, allowing the display to save the changes.
5. Turn of key power, allow application to load, and press the main menu button. Allow main menu to be displayed on the screen for several seconds. An hour glass flash indicates that the planter software is loading on the display. After the hour glass flash, the planter icon appears on the main menu.

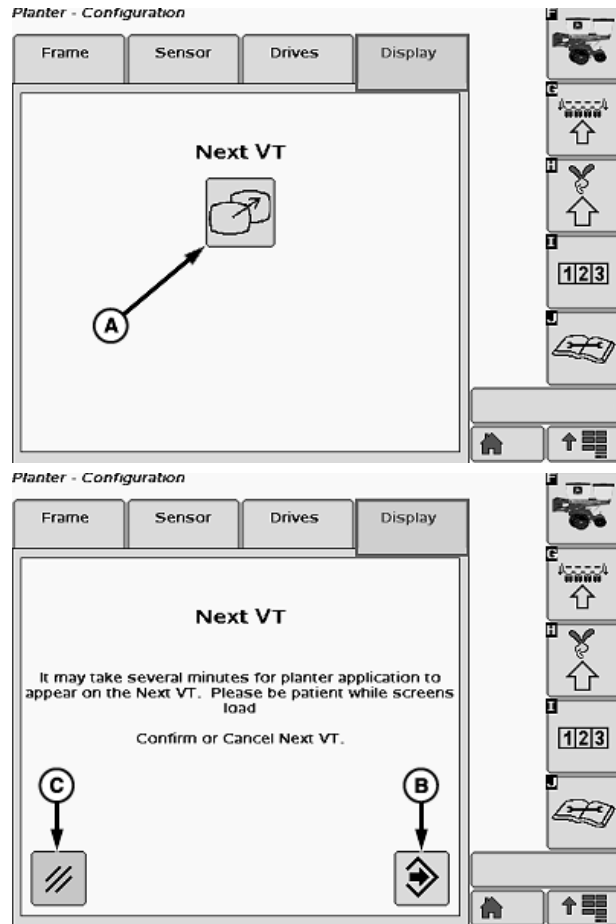

When using the John Deere Tractor CommandCenter™ display and an additional GreenStar™ display:

1. Turn on key power and allow both displays to load. Select Menu on the CommandCenter, then select Display icon (button I).
2. Select Settings button (button J), then select the Multiple Displays button (button H)
3. For SeedStar™ to communicate with the GreenStar™ display. On the Multiple Displays setup page, make sure "Implement Bus Virtual Terminal" box is not checked.
4. Turn off key power to save changes.
5. Turn on key power, allow application to load, select Menu on GreenStar™ display. Allow menu to be displayed on the screen for several seconds. An hour glass flash indicates that the planter software is loading on the display. After the hour glass flash, the planter icon appears on the main menu.

To move planter application from one display to another:

1. With tractor power off, ensure GreenStar™ monitor (2630, 2600, or 1800) is connected to tractor corner post.
2. Make sure that all electrical connections have been made between tractor and planter.
3. Turn on key power. Allow both CommandCenter™ display and GreenStar™ to load. Select main menu button on CommandCenter™ display and select the planter application.

NOTE: The Display tab only appears if two or more ISO compatible displays are on the

A—Next VT (Next Virtual Terminal)
B—Confirm
C—Cancel

implement CAN bus. Next VT feature is not available when actively planting.

4. Once on planter home page, select Planter Setup button (button G). Select Display tab.
5. Select "Next VT" button (A) (this stands for Next Virtual Terminal) to move planter information to the GreenStar™ display.
6. Select Confirm (B) or Cancel (C). Controller will restart.

NOTE: Depending on display configuration it can take up to 255 seconds for planter application to appear on desired display.

Custom Input Keypad

Some input or drop-down boxes have an Edit or Custom option. When Edit or Custom is selected, a keypad appears for data entry. The **Return** (A) button moves cursor to the next line down. The **Appearance** (B) button

toggles between a standard **qwerty** keypad layout and an alphabetical keypad layout. The **Case** (C) button toggles between upper and lower case letters. The **Symbols** (D) button toggles between a keypad with letters and a keypad with symbols.

Screen Layout Manager

IMPORTANT: Planter screen is only available in full screen or half screen. Error messages do not appear on half screen layout. Return to full screen to see messages when an audible alert signals an error.

1. Select **Primary Menu** button.
2. Select **Layout Manager** button.
3. Select a page number from the drop down menu.
4. Select a layout pattern (A) from right side of screen.
5. Select **Include in Home Page Collection** check box (D). Add a check to include this page. Clear the box to remove a page from the collection.
6. Select an area of screen (B) to change.

*NOTE: If single-window layout is selected, select **Enter** button after option is chosen. No need to select preview.*

7. Only the options allowed in this area of screen appear. Select an **option** or select **Previous** button.
8. If an option is selected, a preview of selection appears. Select the **preview** to verify it is correct or select **Previous** button.
9. Select **Enter** button.
10. Select another area of screen to change. Continue until all areas are chosen.
11. To view all active home pages, repeatedly select the **Home** button (C).

Screen Navigation

NOTE: Although information appears similar on competitive displays, the navigational steps can be different. Refer to the operator's manual for your display for specific instructions.

Main Menu

Buttons and Softkeys appear similar. Buttons simply activate a feature or transfer to a new screen. Softkeys open screens where set up and data entry are possible.

The **Primary Menu** (A) button transfers to a screen with selectable buttons for each monitor.

Select a button to transfer to the desired application. The following are a few examples.

- (B) Opens Planter application page. Various planter functions are available.
- (C) Opens Performance Monitor Totals page. Various tractor performance values are available.
- (D) Opens Display Main page. Various monitor functions are available.
- (E) Opens Message Center page. Various messages are available.

The following screen area information is for translation purposes to assist an operator using a screen with English text when the operator does not read English. The left side of the list remains English to match the screen and the right side of the list is translated along with the rest of this manual. The operator matches the English words on screen with English words listed on left side of list and views the translated meaning.

Planter Application Screens

Select **Softkeys** (A) through (E) to transfer to various planter screens. A title (I) at the top of each screen matches the name of the softkey.

Once any screen is displayed, it is not necessary to return to the primary menu before selecting another softkey in the same application. Example: Assume that the current screen is already Planter - Rates screen. If a procedure indicates to select the **Primary Menu** button (H), then the **Planter** button, then the **Configuration** softkey (B) to reach Planter - Configuration screen, simply select the **Configuration** softkey instead. The display is already on a Planter screen. There is no need to start from the Primary Menu again.

- (A) Transfers to Main planter screen, often referred to as the Run page.
- (B) Transfers to configuration screen for frame, sensor, and drives set up.
- (C) Transfers to configuration screen with Crops and Rates.
- (D) Transfers to screen with Totals and Calculators.
- (E) Transfers to diagnostic screen for Readings and Tests.
- (F) Transfers to Message Center.
- (G) Transfers to Home screen.
- (H) Transfers to primary Menu screen with buttons for different applications.

Navigation Example A:

Refer to the following procedure using an active monitor.

1. Select **Primary Menu** button (A).
2. Select **Planter Application** button (B).
3. Select planter **Configure** softkey (C). Planter - Configuration (D) screen title is now displayed.
4. Select **Sensor** tab (E).
5. Select drop-down box (F) and choose **Seed**.
6. Select **Row** input box (G) and enter an individual row number.
7. Select **On** or **Off** check box (H) to configure selected row.

Navigation Example B:

All procedures in this manual use a condensed version of Navigation Example A shown on previous page. The following steps are an example of Navigation Example A, simplified. Each **bold** word is a selectable screen item. The arrows (>>) indicate each screen item to select in sequence. Once common buttons, softkeys, and screen titles become familiar, this technique shortens the reading time needed to accomplish a task. It is not necessary to begin at the Primary Menu if the display is already on the destination screen.

Use an active monitor to become familiar with the display and this style of navigation. If needed, refer back to previous descriptions in this section while learning screen items.

1. Select **Primary Menu** >> **Planter** button >> **Configuration** softkey >> **Sensor** tab.
2. Select **Seed** from drop-down box.
3. Select **Row** input box and enter an individual row number. Select **On** or **Off** check box to configure selected row.

Performance Monitor

Check Implement Width in Performance Monitor

To view current width in Performance Monitor, select **Menu** >> **Performance Monitor** application >> **Settings** softkey.

IMPORTANT: If implement width is changed in the tool application, (for example when changing from corn to soybeans on a split row planter), cycle the display power to update the new settings.

Implement width appears next to implement width icon.

The Performance Monitor operates in two modes on the GreenStar™ Display. Basic Performance Monitor mode (BPM) is included in base equipment with every GreenStar™ Display. Advanced Performance Monitor (APM) is a tractor application and is only available when connected to specific John Deere™ tractors.

Implement width is sent to the Basic Performance Monitor by the planter and cannot be changed as long as the planter is connected to the tractor.

Refer to your GreenStar™ Display operator's manual for more information.

Radar Configuration

Select **Menu** >> **Performance Monitor** button >> **Settings** softkey.

- Clear the **GPS or Ground Radar Connected to Display** check box for John Deere™ 00, 10, and 20 Series Tractors with factory equipped tractor radar.
- Place a check in the **GPS or Ground Radar Connected to Display** check box for John Deere™ tractor models earlier than 00 Series with radar connected directly to the GreenStar™ Cab Harness.
- Place a check in the **GPS or Ground Radar Connected to Display** check box for competitive tractors with radar connected directly to the GreenStar™ Cab Harness.
- For John Deere 30 Series and newer tractors, this step is not required and it is not possible to check this box.
- For (ISO 11783 compliant) competitive tractors with a TECU, this step is not required and it is not possible to check this box.
- If using GPS as a ground speed source refer to your GreenStar™ Display Operator's Manual or see your John Deere™ dealer. Many configurations are possible.

Radar Calibration

IMPORTANT: Perform calibration in the field under seeding conditions. Inflate all tires to specifications given in operator's manuals. Do not inflate to level given on tire sidewall.

Accurate system performance is dependant upon accurate radar calibration.

Some radars are integrated into tractor system. Calibrate these according to tractor operator's manual.

A radar that is connected directly to the GreenStar™ harness is calibrated using the following procedure. Dickey John™ Radar is an example of a radar that is connected directly to the GreenStar™ harness.

1. Select **Menu >> Performance Monitor** button >> **Settings** softkey.
2. Select **Radar Connected To Display** check box and mark with a check.
3. Select **Radar Calibration** button.
4. Follow the three step procedure listed on screen.

Step 1: Measure and mark a 122 m (400 ft.) course. Drive tractor approximately 3.2 km/h (2 mph) without pulling a load. Select **Radar Calibration** button as front tires cross mark at one end of course.

Step 2: Maintain speed. Select **Radar Calibration** button as front tires cross mark at other end of course.

Step 3: Calibration is either successful or unsuccessful. Either a **Previous** button appears to repeat the procedure or an **Enter** button appears to complete the procedure.

Quick Reference and Planter Defaults Setup

Quick Reference			
	>> Sensor		Residual fluid pressure must be released from system. Select each sensor, one at a time, and enter Calibration Value in input box. John Deere sensors are 37.50 (English units) or 258.55 (Metric units). Select zero button to zero sensor reading. Select next sensor and repeat.
	>> Height	>> Common or Separate Check Box	Common sets a single height to start and stop variable rate motors. Separate sets individual start and stop heights for variable rate motors.
		Calibrate full up and full down	Fully raise machine and select Raised button (up arrow). Select Enter. Fully lower machine while driving forward in field and select Lowered button (down arrow). Select Enter.
		Set start and stop point	Common: Select Start/Stop button. Raise machine to correct height and select Start/Stop Height button or enter a value in Input box. Select Enter. Separate: Select Start/Stop button. From lowered position, raise machine to motor stop point and select Stop Height button or enter value in Input box. From raised position, lower machine to motor start point and select Start Height button or enter value in Input box. Select Enter.
	>> Tractor Speed		Select Auto check box to allow display to determine optimal ground speed source (recommended). If unchecked, a drop-down appears. Select drop-down menu and choose sensor source.
Seed Rate Configuration		>> Rates Softkey	
	>> Crop Name Drop Down		Select corn, soybeans or one of the custom crop names.
	>> Edit Crop Name Button		Select to edit names of crops in crop name drop down.
	>> Show Rates Button		(1 rate for all motors or rates for each motor.)
		>> Change Rates Button	To change any rate.
		>> Rate Drop Down	Select rate to change. Use rate 6 for RX.
		>> Motor Drop Down	When equipped with multiple motors and different rates for each motor. Select motor to set a rate. Only visible if box Use one rate for all motors is not selected.
		>> On - Off Drop Down	Set rate to appear or run screen or not.
		>> Target Input Box	Program target rate for selected motor.
		>> High and Low Input Box	Automatically sets ten percent over and under. Select box to change.
		>> Enter Button	Saves program.
	>> Use One Rate for All Motors Check Box		Only visible if multiple motors on machine. Check for one rate across machine. Empty for different rates on each motor.
	>> Disk Type Drop Down		Select type of disk or meter. If custom is chosen, enter number of seeds/holes per revolution.
	>> Seed Disk Drop Down (Vacuum only)		Select disk installed in meter.
	>> Population Adjust Input Box		Enter correction value after performing seed rate check in field.
	>> Rows Planting Check Box		Only visible on split row and twin row machine configurations. These boxes are where rows actively planting is selected.
Planter Calculators		>> Totals Softkey	
	Area Calculators	>> Totals Tab	Select any input box. Change values or zero with Zero button.
	Seed Estimator	>> Calculators Tab >> Seed Estimator	Select one of three estimators; Bag, Unit, or Weight. Enter all values and view result. See Counters and Calculators section for details.
	Vacuum Calculator (Vacuum meters only when vacuum meters are set up)	>> Calculators Tab >> Vacuum	
		>> Top Drop Down	Select Vacuum
		>> Seeds per kg (lb.) Input Box	Enter number of seeds per kg (lb.)
		>> Disk Type Drop Down	Select type of disk in meter.
		>> Seed Disk Drop Down	Select disk. Set vacuum to suggested value as a starting point.
Diagnostics			
	>> Diagnostic Softkey >> Readings tab.	>> Hardware/Software	Provides system data. On large frame planters with more than one controller, select each controller separately from the drop-down.

SeedStar™ 2 Initial System Configuration

SeedStar™ 2 System Overview

The SeedStar™ 2 monitoring system is a full-featured, color planter monitor that works with your GreenStar™ 2 or ISO 11783 compliant display to provide all vital planting information in one location.

SeedStar™ 2 provides the following information:

- Planter average and individual row seed population.
- Vacuum level monitoring.
- Fertilizer pressure monitoring.
- Area counters and productivity monitoring.
- RowCommand™ control and monitoring.
- Variable rate drive (VRD) control and monitoring.
- Single Set-point integrated pneumatic down force control and monitoring.
- Alarms, cautions, and diagnostics.

The SeedStar™ 2 planter monitoring system works with a GreenStar™ 2 or competitive ISO 11783 compliant

display and is fully compatible with John Deere™ AMS applications such as Field Doc™, Swath Control Pro™ for planters, GreenStar™, AutoTrac™ Assisted Steering System, Apex™ Farm Management Software, Field Doc™ Data Collection, iGuide™, and others.

The Planter Main 1 (PM1) controller accepts signals from the controllers and sensors on the tractor and planter and communicates them via CAN Bus communication to the display in the tractor cab.

Machines equipped with Set-Point Integrated Pneumatic Down Force have an additional controller to adjust and monitor the pneumatic row unit down force system. The Planter Main 2 (PM2) controller receives inputs from the GreenStar™ display and controls the solenoid valves at the air storage tank to achieve faster changes in row unit down force from the cab. A low-pressure alarm is provided to alert the operator of system leaks.

OUC6064,00005B6 -19-01MAR13-1/1

System Components

CAN Harness Connection

The ISO standard Controller Area Network (CAN) Harness connection is the primary connection between the implement and the tractor for the SeedStar™ monitor system.

CAN Harness Connection

OUC6064,00005B7 -19-10NOV11-1/12

Planter Main 1 Controller (PM1)

This control unit:

- Provides the main planter software application and user interface on the GreenStar™ display.
- Contains all the setup information for the planter.
- Receives and processes signals from the seed sensors.
- Controls the variable rate drive system (if equipped).
- Controls the RowCommand™ system (if equipped).

Planter Main 1 Controller (PM1)

A50167 —UN—09SEP02

OUO6064,00005B7 -19-10NOV11-5/12

Seed Tube with Seed Sensor

The seed sensor is used to monitor seed activity at each row unit. Seed information is processed with the Planter Main 1 (PM1) controller and displayed on the GreenStar™ display. SeedStar™ 2 monitoring systems use seed sensor data to calculate and display individual row and planter average seed population to the operator.

Seed Tube with Seed Sensor

A67677 —UN—11JUN10

OUC6064,00005B7 -19-10NOV11-6/12

Vacuum Sensor

The vacuum sensors provide the vacuum level signal to the Planter Main 1 (PM1) controller. There is one vacuum sensor for each vacuum fan on the planter.

Pneumatic Down Force System Air Compressor (Machines With Single Set-Point Integrated Pneumatic Down Force)

The pneumatic down force air compressor supplies pressurized air to the air storage tanks on SeedStar™ 2 Set-Point Integrated Pneumatic Down Force planters. Electrical power for the air compressor is provided using the tractor convenience outlet or directly from the tractor battery. A pressure switch located on the pneumatic down force control valve operates a relay on the compressor unit to turn the compressor on and off.

A59173 —UN—29JAN07

NOTE: Row configuration is the overall machine layout.
Do not change this selection once set.

2. Select **Row Configuration** drop-down box and choose how rows are configured on machine.
 - Single Row Configuration (A): Row spacing is measured between each adjacent row. Example: 1775NT
 - Split Row Configuration (B): Row spacing is measured between each adjacent row even if row units are on different frame components. Example: 1795
 - Twin Row Configuration (C): Row spacing is measured from the center of each set of adjacent twin rows. Example: 1705 Twin Row

How to Switch Between Wide and Narrow Split Rows or Single and Twin Rows:

- a. Select **Rates** softkey.

NOTE: The monitor automatically adjusts rows, spacing, and machine width based on the box checked.

To ensure that all settings update, select the rows planting check box even if a check mark is already in the box.

- b. Select **Rows Planting** check box to choose the row configuration monitored.

Cycle power whenever a change is made to ensure that updates are recorded.

NOTE: If number of rows is changed, RowCommand™ must be enabled again. (Refer to drive section configuration.)

3. Select **Rows** input box. Enter total number of rows on machine.
4. Select **Row Spacing** input box. Enter the spacing distance for selected configuration as determined in previous step.
5. Planter **Width** is automatically calculated. To enter the width manually, select input box and enter a value.
6. Select **Clutch Disconnect Warning** check box to enable or disable the partial width alarm. When enabled, a full page warning displays for 5 seconds whenever a clutch or drive section is disengaged. A message is displayed on Message Center softkey and monitor beeps every 15 seconds as a reminder.

Pneumatic Down Force—Air Pressure Sensor

1. Select **Menu** >> **Planter** button >> **Configuration** softkey >> **Sensor** tab.
2. Select **PDF Air Pressure** from drop-down box.

NOTE: Step value option is only displayed in the Pneumatic Down Force—Air Pressure Sensor setup screen for Non-XP (Enhanced Monitoring) equipped machines.

3. Select **Step Value**, enter a value for the pneumatic down force system to increase or decrease when adjustment arrows (on run screen) are used for adjustment.

NOTE: PDF low alarm option is only displayed in the Pneumatic Down Force—Air Pressure Sensor setup screen for Non-XP (Enhanced Monitoring) equipped machines.

4. Select **PDF Low Alarm** to set the pressure to determine margin. the default setting from the factory is (40 lb.)
5. Select **Cal Value** input box and enter the calibration value of 494.00.

NOTE: Current down force is displayed on bottom left of screen.

6. Relieve air pressure before selecting the **Zero Sensor** button.

Calibrate Common Start and Stop Height

Use this procedure to set a single point to start and stop RowCommand™ and Variable Rate Drive (VRD) motors as the machine raises and lowers. Common start/stop points are used when machine is equipped with row unit parallel-arm height switches. Machines with a wheel frame height sensor can use separate start/stop points.

1. Select **Menu** >> **Planter** button >> **Configure** softkey >> **Sensor** tab.
2. Select **Height** from drop-down box.
3. Select **Common**.
4. Completely raise machine in field raised position.
5. Select **Planter Raised** button. Select **Enter** button.
6. Lower machine completely while driving forward under seeding conditions.
7. Select **Planter Lowered** button. Select **Enter** button.
8. Select **Start/Stop** button.

IMPORTANT: Start/stop point must be manually set to 50 for integral planters with single action height switches on row unit parallel arms.

NOTE: A set point less than 20 is not recommended with wheel frame height sensor.

9. With Wheel Frame Height Sensor: From the fully lowered position, raise machine until the desired start/stop point is achieved and select **Set Height** button. Recommended setting is with openers at soil surface.
10. If setting needs slight adjustment after planting begins, select input box and adjust value in small increments.
11. Select **Enter** button.

Ground Speed Source

1. Select **Menu** >> **Planter** button >> **Configuration** softkey >> **Sensor** tab.
2. Select **Tractor Speed** from drop down box.
3. **Auto** box checked is the recommended option. Radar speed and tractor wheel speed are shown on bottom of screen. The active source used at this moment is displayed in the middle of the screen.
4. To force the monitor to use only one speed source, clear **Auto** check box.

IMPORTANT: Entering a manual speed is an option. A single speed value must be entered. The monitor assumes the planter is always travelling this speed. Travel at this speed for most accurate monitor readings. All rates and warnings are based on the speed entered, not the actual ground speed.

5. Select a single speed source; **Radar**, **Wheel Speed**, or **Manual**.

SeedStar™ 2 Variable Rate Drive Configuration

Variable-Rate Drive (VRD) Overview

A Variable-Rate Drive (VRD) system uses one or more hydraulic motors to turn the seed meters. Various sensors along with data entered into the monitor by the operator determines meter speed required to achieve a chosen population.

VRD features provide additional performance over mechanical drives.

- Manually change seed rates from the cab without stopping.
- Manually change seed rates when crossing different soil types.
- Manually change seed rates when crossing transitions between irrigated and non-irrigated ground.
- Program up to five different seed rates to choose from while planting.
- Use multiple VRD motors to seed different rates with each hydraulic drive motor or select the same rate for all motors.
- Compatibility with APEX software and Map Based Planter Field Doc™ to design a prescription plan that automatically adjusts seed rates in the field.

System Components

- **Hydraulic Motor** - Motor turns planter drive shafts and meters.
- **Valve and Solenoid** - Varies oil flow to motor.
- **Motor Sensor** - Monitors motor speed.
- **Height Sensor or Switch** - Monitors frame height.
- **Motion Sensor** - Monitors planter wheel rotation.
- **Tractor Radar or GPS Receiver** - Indicates ground speed.
- **System Controller** - Processes all signals and data input.
- **Monitor Display** - Presents data and accepts operator input.

Hydraulic Requirements

Tractor must have either a load sensing hydraulic system or a closed center hydraulic system with flow control. These types of hydraulic systems usually have large oil reservoirs and increased oil cooling capacity. They only deliver the oil flow needed for the VRD motors to maintain a constant speed.

Each VRD motor requires a nominal hydraulic oil flow of 3.79 to 30.28 L/min. (1.0 to 8.0 gpm) at 3447 to 10 342 kPa (500 to 1500 psi).

NOTE: Tractors with open center hydraulic systems are not recommended for the following reasons:

- *No control of oil flow volume.*
- *Excessive oil temperature.*
- *Decreased oil flow to motor during operation of other tractor control valves.*

System Functionality

- **SeedStar™ 2 Controller (PM1):** A controller mounted on the planter frame receives power from the tractor and signals from all the system components. The controller processes all the information, controls the hydraulic motor valve, and provides information to the monitor display. The controller communicates over a CAN (Controller Area Network) system. SeedStar™ 2 is compatible with John Deere GreenStar™ 2 1800 and 2600 displays and ISO 11783 compliant competitive displays only.
- **Monitor Display:** A monitor accepts operator inputs and sends data to the controller. The monitor also displays data received from the controller.
- **Height Sensor:** Most drawn planters use an adjustable wheel frame height sensor to start and stop seeding at chosen points as the planter is lowered and raised. The start and stop points are input and adjusted by the operator on the GreenStar™ 2 display.
- **Height Switch:** Most integral planters use one or more push button switches mounted on a row unit parallel arm. The switch compresses when the planter is raised and release when lowered. **Two Switch System:** One switch is installed on the far left side of the machine, and one switch on the first row unit to the right of center. If only one switch is compressed, the drives continue to turn. Uneven ground can cause one switch to compress while one switch remains in the released position. Drives only stop when BOTH switches are compressed as planter is raised.
- A tractor mounted radar or GPS receiver determines ground speed.
- A wheel motion sensor mounted on a planter wheel detects motion and indicates the planter is moving. This is a safety feature validating the ground speed signal from the radar or GPS receiver.
- Power to the variable-rate drive motors is supplied by continuous hydraulic flow from the tractor. The controller signals a solenoid operating a hydraulic valve on the motor to control motor speed.
- A speed sensor mounted on the motor shaft detects motor speed for feedback to the SeedStar™ controller.

NOTE: Population readings detected by seed sensors do NOT control motor speed.

- The operator enters data into the monitor for seed rates, seed disks, seed meters, row spacing, motor sprockets, and frame position. The controller uses other operator entered data to adjust motor speed and therefore meter speed.

The following components must be active for system operation:

- **Monitor operation**—Monitor and controller must have electrical power.
- **Seed Rates**—One or more must be entered and turned ON from the Planter - Rates screen.

Continued on next page

OUC06064,00001F1 -19-30JUN10-1/3

- Continuous hydraulic oil flow—Oil must be flowing to motors.
- Ground Speed from the tractor—Controller must detect ground speeds greater than 1.6 km/h (1 mph).
- Wheel motion sensor—Controller must detect planter wheel motion.
- Height Sensor or Switch—Must be calibrated and controller must detect that planter is lowered.

To view current status of VRD inputs, Select **Planter** >> **Diagnostics** softkey >> **Readings** tab >> **VRD Data** from drop down menu.

In order for variable-rate drive to work, seed rates must be entered and turned ON from the Planter - Rates screen.

During normal operation, a visual indicator appears on the RUN screen when motors are operational. The gear indicator sections fill in, one at a time based on system activity, then turn solid green to indicate at least one motor is operational.

System Performance

Low speeds affect performance. Motor performance becomes marginal at speeds less than 3.2 km/h (2 mph) and stops at speeds below 1.6 km/h (1 mph). NO monitor warnings are given at speeds below 3.2 km/h (2 mph).

Extreme and sudden changes in speed cause a decrease in population and spacing accuracy. To start from a stopped position, use high idle and a low gear. Gradually

upshift and increase speed from 3.2 km/h (2 mph) to target speed to allow the VRD system time to adjust. Use Quick Start feature to improve initial motor activation. Downshift instead of idling down to turn on ends of field. Attain 3.2 km/h (2 mph) before lowering the planter and gradually upshift to target speed.

Field Doc is a trademark of Deere & Company

Continued on next page

OUC6064.00001F1 -19-30JUN10-2/3

Quick Start Overview

A skip is an area where seed is expected, but has not been planted.

The Quick Start feature allows the operator to reduce a skip when the planter starts from a stop. Quick Start reduces the skip to approximately 0.3—1.2 m (1—4 ft.).

When Quick Start is selected and activates, the control unit engages the motors at the minimum operational rpm represented by a target ground speed. The motors overpopulate until actual ground speed reaches the target speed calculated by the control unit.

For example:

Population	Row Spacing	Minimum Speed
37 000 seeds/hectare (15 000 seeds/acre)	76 cm (30 in.)	4.8 km/h (3 mph)
74 000 seeds/hectare (30 000 seeds/acre)	76 cm (30 in.)	2.4 km/h (1.5 mph)

The control unit must detect the four following conditions before Quick Start activates:

- Quick Start must be enabled by selecting **Planter** application >> **Planter Configuration** softkey >> **Drives** tab >> **Settings** button >> check **QS Enabled** check box. Select **Enter** button.
- Actual measured radar speed must be less than minimum ground speed.
- Planter wheel motion must be detected.
- Planter frame height must indicate a lowered position.

To use **Quick Start**:

1. Raise planter.
2. Begin forward travel in a low gear at high idle.
3. Select QS Reset on display.

Quick Start Reset Button

4. Lower planter. When the height sensor indicates a lowered position "QS 6" appears on screen and begins counting down. The VRD motors engage at the minimum speed.
5. Gradually shift up to planting speed.

When timer reaches zero, the control unit checks for a minimum ground speed of 1.6 km/h (1 mph). If minimum speed is not reached, system shuts down. If speed is over minimum, but less than target, timer resets to 6 seconds. When timer reaches zero again, the control unit checks for the minimum ground speed again. If minimum speed is not reached, system shuts down. If speed is over minimum, but less than target, motors continue to run below optimum limits and a warning is issued to increase speed. If target speed is reached at any point while timer is active, Quick Start deactivates and normal operation resumes.

AG7930—UN—30JUN10

OUE6064,00001B3 -19-30JUN10-1/1

Rotate Seed Meters Overview

CAUTION: Avoid injury from rotating drive components. Ensure everyone is clear of drive components before activating variable-rate drive.

The Rotate Seed Meters feature allows the operator to rotate the seed meters by activating the variable-rate drive motors while machine is stationary. The meters fill with seed as meters rotate. Full meters reduce the area traveled before seeds meet the soil when starting from a stop.

The following must occur for this feature to function:

- Planter must be unfolded.
- Planter must be in raised position.
- Planter must be stationary.
- Variable rate hydraulics must be active.
- If equipped with vacuum, vacuum must be at operating pressure to hold seeds on meter disks.

Select **Meter Rotation** button on Main Planter screen to rotate meters. An audible tone sounds when meters stop turning. Each time the icon is pressed, the meters rotate

Meter Rotation Button

approximately one half a revolution. Select the button at least three times to completely fill seed meters. If meters fail to move, a warning screen appears.

NOTE: When Rotate Meter function is used in conjunction with RowCommand™, RowCommand™ clutches will be de-energized (meters engaged).

This feature may also be used as a diagnostic tool for the variable rate drive.

OUO6074,0000F7C -19-31JUL09-1/1

A59898 —UN—02APR07

System Components

Variable Rate Drive (VRD) Motor and Valve

The VRD motor turns the seed meter drives at a speed controlled with the valve. The seed population entered in the monitor determines the motor speed. The solenoid valve receives electrical signals from the controller and adjusts oil flow to the motor. The planter configuration determines the quantity of VRD motors.

Variable Rate Drive Motor and Valve

Enable Variable-Rate Drive Software

NOTE: Planters are configured with the appropriate drive source from the factory.

IMPORTANT: A Drive Source change resets all planter settings to default values and requires cycling power to the display and controller.

Always configure Drive Source before planter settings are entered.

Confirm the Planter Drive source is listed as Variable-Rate from the **Planter Configuration** softkey >> **Drives** tab.

Height sensor must be calibrated and seeding rates must be defined and turned ON before operation.

OUO6064,00001F2 -19-30JUN10-1/1

Configure Planter Drive Sections

IMPORTANT: Complete the frame configuration first.

1. Select **Menu** >> **Planter** button >> **Configure** softkey >> **Drives** tab.
2. Select **Drive Sections** from the drop-down box.
3. Select **Settings** button and set the number of motors on machine.
4. To enable RowCommand™, check the **Row Command** box.

NOTE: Dual Range Drive System check-box is only visible if monitor is configured for twin row machines. (See Configure Frame Layout, Row Layout, and Drive Disconnect Warning in SeedStar™ 2 Initial System Configuration section.)

5. Place a check in the **Dual Range Drive System** box on twin row machines that use a high-low range gear in the drive system between the VRD motor and the drillshaft.

NOTE: Adjust sprockets to match monitor on twin row machines. (See High-Low Drive Range in Seed Rate Configuration section.)

6. Select **Next Page** button. Set up one motor at a time. Perform the following:

NOTE: Row number one is always on left-hand side of machine while facing direction of travel.

- Select **End Row** input box and enter the far right row number that the selected VRD motor controls.
- Select **Disconnect** drop-down box and assign a section of the machine to selected VRD motor.

IMPORTANT: When the auto width disconnect is activated, all rows assigned to that disconnect stop planting and the monitor does not signal a failure until all rows are activated again.

IMPORTANT: When using RowCommand™, the auto width disconnect feature is turned off.

NOTE: Tooth count is stamped on the side of sprocket.

NOTE: Middle Driven and Middle Driver input boxes are only visible when Dual Range Drive System is enabled.

- Select **Motor Sprocket**, **Middle Driven**, **Middle Driver**, and **Final Driven** (Sprocket) input boxes and enter number of sprocket teeth for selected VRD motor.

7. Repeat for each motor.

8. Select **Enter** button.

NOTE: Warning message is not displayed on half screen layout.

SeedStar™ 2 RowCommand™ Configuration

RowCommand™ Overview

The RowCommand™ system uses electric clutches located at each row unit to shut off the seed meters when commanded by the operator or by SwathControl Pro™ software. RowCommand™ clutches are designed so that the seed meter turns when the clutch is not powered. To turn a row unit clutch on or off, the SeedStar™ 2 controller sends a CAN Bus message to the Electronic Power Module (EPM) for that clutch. The EPM processes the message and applies electrical power to the clutch solenoid to turn it off and removes electrical power to

turn it on. The RowCommand™ system allows up to 16 control sections to be set up for the planter. Control sections cannot go across VRD drive sections and should be a minimum of 60 inches wide for best performance with SwathControl Pro™. When used with SwathControl Pro™, RowCommand™ on and off times must be calibrated for the specific tractor and planter configuration being used. Refer to the SwathControl Pro™ section of your GreenStar™ Display Operators Manual for detailed setup information.

OUC06064,00001A9 -19-08JUL10-1/1

System Components

RowCommand™ Electronic Power Module

The Electronic Power Module receives CAN bus messages from the Planter Main 1 (PM1) controller and switches electrical power to the RowCommand™ clutches on and off.

RowCommand™ Electronic Power Module

RowCommand is a trademark of Deere & Company

Pro-Shaft™ RowCommand™ Clutches are available on MaxEmerge™ XP, and MaxEmerge 5 and Pro-Series™ units.

The RowCommand™ chain driven clutches are available on MaxEmerge™ XP and MaxEmerge™ 5 units.

The RowCommand™ Clutch is engaged (seed meter turning) when there is no electrical power applied to the clutch solenoid. The clutch is disengaged when the electronic power module (EPM) supplies electrical power to the clutch solenoid.

Configure RowCommand™

1. Select **Menu** >> **Planter** button >> **Configure** softkey >> **Drives** tab >> **Drive Sections** drop-down box >> **Settings** button.
2. Check **RowCommand™** box to enable. Select **Next Page** icon.
3. If equipped with variable rate drive, the motor setup appears on-screen. Select **Next Page** icon until the setup for row control sections appears on-screen:

IMPORTANT: RowCommand™ sections must not overlap the physical drive sections on the planter. Plan the configuration appropriately.

NOTE: (See *Recommended RowCommand™ Configurations* in this section.)

- a. Enter number of RowCommand™ control sections in input box. Select **Next Page** icon.

IMPORTANT: 152 cm (60 in.) is the minimum width of a section. If planter is on 76 cm (30 in.) row spacing a minimum of 2 rows must be entered per section.

Example: A 1795 operating on 38 cm (15 in.) spacing has four rows per 152 cm (60 in.). A minimum of four rows per section is entered.

IMPORTANT: Avoid a tractor low voltage warning. If many RowCommand™ clutches are simultaneously energized (meters disengaged), reduce the electrical load or increase engine rpm.

- b. Enter the right-hand row number for each section using the input box. Select **Next Page** icon to toggle through each section. (See *Recommended RowCommand™ Configurations* in this section.)
- c. When complete, a visual representation of the configuration appears. Select **Enter** to confirm setup. Select **Enter** again. Cycle power when prompted.

To edit row control sections select **Menu** >> **Planter** button >> **Configure** softkey >> **Drives** tab >> **Row Control Sections** drop-down box >> **Settings** button.

If **Row Control Sections** does not appear in drop-down box, RowCommand™ has not been enabled. Repeat RowCommand™ configuration procedure.

4. Calibrate start and stop height for planter. (See *Calibrate Common Start and Stop Height* or *Calibrate Separate Start and Stop Height* in the SeedStar™ 2 Initial System Configuration section.)

SeedStar™ XP Enhanced Monitor System Configuration

SeedStar™ XP Monitoring System Overview

SeedStar™ XP is an optional monitoring system that provides more detailed information about the planting operation to the operator. SeedStar™ XP retains all the features and capabilities of SeedStar™ 2 and adds the following functions:

- Seed Singulation Monitoring
- Seed Spacing Monitoring
- Set-Point Row Unit Down Force Monitoring
- Optional Active Down Force Control
- Row Unit Ride Quality Monitoring

The Planter Main 1 controller (PM1) uses signals from the existing seed sensors to provide Seed Singulation and Seed Spacing information for a more detailed indication of seed meter and overall planter seed spacing performance.

The Planter Main 2 controller (PM2) uses data from the sensor node controllers and gauge wheel down force sensors to calculate row unit down force and row unit ride quality information. This information is sent to the Planter

Main 1 controller and displayed on the monitor to enable the operator to fine-tune the planter to optimize row unit penetration, seed depth control, and seed to soil contact.

The optional Active Down Force system uses a hydraulically driven compressor that works with the SeedStar™ XP system to automate down force control. Once the operator sets the target margin value the active pneumatic down force system works automatically to make sure that the planter maintains this value achieving precise soil penetration, and consistent planting depth, without sidewall soil compaction.

This system also offers a dual rank control feature for split row planters. In addition to actively controlling the pneumatic down force system across the planter, John Deere™ active down force controls the front and rear rows of a split row planter independently. This feature compensates for differing down force requirements between the ranks and maintains an accurate planting depth and consistent margin across all the rows.

OUC6064,00005BE -19-10NOV11-1/1

System Components

Planter Main 2 (PM2) Controller

This control unit:

- Collects data from sensor node controllers.
- Communicates row unit ride dynamic and down force information to Planter Main (PM1) controller.
- Controls and monitors pneumatic down force system.

Planter Main 2 (PM2) Controller

A66613 —UN—22FEB10

OUC6064,00005BF -19-10NOV11-1/6

Sensor Node Controller

This control unit:

- Collects down force loads from gauge wheel down force sensors.
- Senses row unit ride dynamics.
- Communicates row unit dynamic and gauge wheel down force information to Planter Main 2 (PM2) controller.

Depending on planter model, there are between 3 and 7 sensor nodes on the planter, with one sensor node per frame section. In most cases, extra wiring harness length is provided to allow the sensor node to be moved one row to either side of the factory location.

Sensor Node Controller

A66615 —UN—22FEB10

Continued on next page

OUC6064,00005BF -19-10NOV11-2/6

Gauge Wheel Down Force Sensor

This component senses the amount of load that the row unit gauge wheels are carrying. The gauge wheel load signal is processed with the sensor node controller and communicated to the Planter Main 2 (PM2) controller. Depending on planter model, there are between 3 and 7 gauge wheel down force sensors on the planter, with one sensor per frame section.

Gauge Wheel Down Force Sensor

A66614—UN—22FEB10

OUO6064,00005BF -19-10NOV11-3/6

Seed Sensor

The seed sensor is used to monitor seed activity at each row unit. Seed information is processed with the Planter Main (PM1) controller and displayed on the GreenStar™ display. SeedStar™ XP monitoring systems use seed sensor data to calculate and display seed singulation and seed spacing information, in addition to seed population.

Seed Sensor

Pneumatic Down Force Air Compressor, Air Tank, and Solenoid Control Valve - Drawn Planters With CCS (Dual Set-Point and Active Down Force)

A72531 —UN—12SEP11

Pneumatic Down Force Air Compressor, Air Tank, and Solenoid Control Valve - Drawn Planters Without CCS (Active Down Force)

A72532 —UN—12SEP11

A hydraulic powered air compressor supplies pressurized air to the air storage tank on planters equipped with the optional Active Down Force system. Once a down force target margin (the amount of extra down force applied to the row unit, over and above what is required for the opener disks to penetrate the soil and achieve full planting depth) is set, the system uses the readings from the gauge wheel down force sensors to automatically make pressure changes to the air spring system to maintain the target margin. As field conditions change the system automatically makes the necessary pressure adjustments to maintain the target margin.

When going through waterway or other field conditions where changes in down force can be ignored, the system

can be paused so no unnecessary changes to the active pneumatic down force (PDF) system occur. For example in waterway, if pause is not activated the active PDF system reacts to the margin dropping due to hard soil and increase PDF force in the air springs. Then when exiting the waterway, it senses that the margin is now too high and have to reduce PDF down force to achieve the target margin. This overshoot, undershoot situation can be avoided by pausing the active system before entering a waterway.

The solenoid control valves located on top of the main tank are controlled and monitored with the Planter Main 2 (PM2) controller.

OUC6064,00005BF -19-10NOV11-5/6

Pneumatic Down Force Pressure Sensors (Dual Set-Point and Active Down Force)

The Pneumatic Down Force Pressure Sensors sense the amount of air pressure in the air spring circuit for single-rank and split-row (dual rank) planters. The Planter Main 2 (PM2) controller uses the pressure sensor signal to adjust the pressure in the air spring circuit to achieve the down force setting entered by the operator.

Pneumatic Down Force Pressure Sensors (Active Down Force) (Dual Set-Point Valve Shown)

Ride Dynamics Sensor Configuration

NOTE: Changing the sensor and row values on the Ride Quality screen also changes the Down Force configuration screen.

1. Select **Menu >> Planter** button >> **Configuration** softkey >> **Sensor** tab.
2. Select **Ride Quality** from drop-down box.
3. Select number of ride quality sensors on machine from **Sensors:** drop-down box.

NOTE: Current load is displayed on bottom left of screen.

4. Select each sensor, one at a time, from the **Sensor** drop-down box.
5. Identify which row the first sensor is installed. See Sensor Quantities and Locations chart. Select **Row** and assign the row number to the selected sensor.

NOTE: The **Rank** input box only appears when the Planter Main 2 (PM2) controller detects the PDF¹ enabled signal, indicating the presence of a hydraulic compressor.

6. Select a rank for each sensor from the **Rank** drop-down box. See Sensor Quantities and Locations chart for rank information.
7. Select **Enable** check box to enable or disable the sensor.

NOTE: When planting with only the front rank of a split row planter, disable all sensors on the rear rank.

8. Repeat row assignment for additional sensors.

NOTE: Controller must be restarted when ride dynamic sensors are enabled or disabled for all settings to take effect.

Configuration Softkey

9. Cycle key switch power.

Alarms and Limits Setup Page

The Alarms and Limits Setup Screen allows the operator to adjust the levels at which cautions and alarms occur for each of the SeedStar™ XP monitor features.

For Set-Point Pneumatic Down Force controlled machines Target Margin must be set and adjusted from this screen.

If any of the monitored values go beyond the alarm set point, the bar graph and background of the numerical display changes to red.

Enter "0" in any of the alarm set point boxes to disable the alarm for that function.

1. Select **Menu >> Planter** button.
2. Select and hold any **SeedStar™ XP Monitor** button for 4 seconds.
3. Select **Singulation Alarm Box (A)** to enter the minimum acceptable singulation percentage. Default singulation alarm setting is 92 percent.
4. Select **Spacing CV Alarm Box (B)** to enter the minimum acceptable coefficient of variation value. Default spacing alarm setting is 0.35.
5. Select **Ride Quality Alarm Box (C)** to enter the minimum acceptable ride quality percentage. Default ride quality alarm setting is 90 percent.
6. Select **Step Value Box (D)** to enter the incremental value the down force changes when the increase or decrease arrows are used to adjust the pneumatic down force. Increments can be set between 1 and 50.

NOTE: Active PDF pause timer box is only available for Active Pneumatic Down Force controlled machines.

7. Select **Active PDF Pause Timer Box (I)** to set the amount of time that the Active PDF system is inactive when the Pause button is depressed on the main run screen.
8. Select **High Margin Alarm Box (F)** to enter the high range for row unit down force margin. Default margin alarm setting is 75 percent above the target margin.
9. Select **Target Margin Box (G)** to set and adjust target margin from this screen. If equipped with Active Pneumatic Down Force, target margin can also be set on the run page.
10. Select **Low Margin Alarm Box (H)** to enter the low range for row unit down force margin. Default margin alarm setting is 50 percent below the target margin.
11. When complete select **Enter (I)**.

Ground Driven Machines—Target Population and High-Low Warnings

IMPORTANT: Population and High-Low warnings are entered differently for variable rate drive machines. See VRD MACHINES—CONFIGURE METER, CROP, DISK, AND RATES in this section.

1. Select **Menu** >> **Planter** button >> **Rates** softkey.
2. Select **Crop Name** drop down box and choose corn, soybeans, or one of the custom crop names.
3. Select **Edit Crop Name** button to change crop name.
4. Select **Target Rate** input box and enter value.
5. High and low warning limits are automatically set to a percentage above and below the target rate. To change limits, select **High** and **Low Warning** input boxes and enter new value.

NOTE: Rates and warning setpoints are saved for each crop name.

6. Select **Population Adjust** input box and enter value.

NOTE: Number of rows planting check boxes are only visible if monitor is configured for a split row and twin row machines. (See CONFIGURE FRAME LAYOUT, ROW LAYOUT, AND DRIVE DISCONNECT WARNING in SETUP Initial System Configuration section.)

NOTE: To ensure all settings update; actively select the rows planting check box even if a check mark is already in the box.

7. Select **Rows Planting** check box for appropriate rows planting configuration.

VRD Machines—Configure Meter, Crop, Disk, and Rates

1. Select **Menu** >> **Planter** button >> **Rates** softkey.
2. Select **Crop Name** drop down box and choose corn, soybeans, or one of the custom crop names.
3. Select **Edit Crop Name** button to change crop name.
4. Select **Show Rates** button.
5. Select **Change Rates** button.
6. If setting different rates for each motor, select **Motor** drop down box to choose a motor to assign rates.

NOTE: Each motor must have a rate set for each rate selected.

7. Select **Rate** drop down box and choose a rate to assign population.
8. Select **Target** input box and enter the target population for selected rate. High and Low population (warning) limits are automatically set to a percentage above and below the target rate. Select **High** and **Low** input boxes to manually adjust warning limits.

IMPORTANT: Variable Rate Drive is inoperative until at least one target rate has been defined AND turned ON.

NOTE: Rate 6 is used for map based prescription. To enable controller to use a prescription, select the "On" drop-down box under rate 6 and from RUN screen select the Rx rate. Once selected, run page has a small Rx indicator near the Target Seeds per Area icon.

9. To see a rate on the RUN page as a choice, select **On – Off** drop down box and choose **ON**.
10. Select **Enter** button.
11. Average Spacing shown on the bottom of the screen is the CALCULATED distance between plants based on the row width and target population entered in monitor

12. Use One Rate for All Motors

- Select check box to enable all motors to use one rate.
- Leave check box empty when different rates are used for each motor.

13. Select **Disk Type** drop down box.

- If planter is configured for **mechanical meters**, plateless meter selections appear. Select the plateless meter installed on machine.

NOTE: If custom plateless is selected, select **Seeds per Rev.** input box and enter value.

- If planter is configured for **vacuum**, types of vacuum disks appear. Select the type of disk installed in meters.

Menu

Planter Button

Rates Softkey

NOTE: If custom vacuum is selected, select **Holes Per Disk** input box and enter value.

14. Select **Seed Disk** drop down box and select the vacuum disk used.
15. Select **Population Adjust** input box and enter value.

NOTE: Number of rows planting check boxes are only visible if monitor is configured for a split row or twin row machines. (See **CONFIGURE FRAME LAYOUT, ROW LAYOUT, AND DRIVE DISCONNECT WARNING** in **SETUP Initial System Configuration** section.)

NOTE: To ensure all settings update; actively select the rows planting check box even if a check mark is already in the box.

16. Select **Rows Planting** check box for appropriate rows planting configuration.

NOTE: High and Low Range check boxes are only visible if monitor is configured for twin row machines. (See **CONFIGURE FRAME LAYOUT, ROW LAYOUT, AND DRIVE DISCONNECT WARNING** in **SETUP Initial System Configuration** section.)

17. Select **Drive Range** check box for high or low configuration.

Population Adjust (PA)

IMPORTANT: Ensure that seed meters are properly adjusted and perform an in field population check **BEFORE** using Population Adjust.

PA (POPULATION ADJUST) is beneficial when planting high population rates or planting small seeds. Under these two conditions, some sensors detect fewer seeds than are delivered. To adjust for the undetected seeds, a correction factor must be calculated and entered into the monitor to adjust the displayed population.

PA is the correction factor the operator calculates and enters into the monitor. Sensor detections are multiplied by the correction factor before display. A PA number of 1.00 displays actual sensor detections. A PA number of 2.00 displays twice the number of actual sensor detections.

A field population check **MUST** be performed to determine the correct PA correction factor.

Always reset Population Adjust factor back to 1.00 when changing crops, seed varieties, or populations. Calculate new PA factor only if necessary.

Example:

If 160 000 seeds are detected and displayed when 180 000 are planted, divide 180 000 by 160 000 to obtain a PA value ($180\,000 \div 160\,000 = 1.13$). Enter a PA value of 1.13 into monitor. The monitor multiplies each detected seed by 1.13 and displays an adjusted population of 180 000.

1. Select **Menu** >> **Planter** button >> **Rates** softkey.

NOTE: Initial PA setting is always 1.0. PA value other than 1.0 is not needed for soybeans when AccuCount™ seed tube sensors are used. AccuCount™ sensors are identified by a red LED (A) on the outside of sensor housing.

2. Select **Population Adjust** input box.
3. Enter the calculated value. Acceptable range is between 0.1 and 2.5.
4. Perform an in field population check and adjust PA value until monitor displays the same value as actual population.

High-Low Drive Range (Twin Row Machines with Intermediate Sprockets)

Variable Rate Drive Machines Only: Configure the variable rate drive sprockets based on seed population and seed disk selection. See table below.

Variable Rate Drive Population Rates at 8 km/h (5 mph) Ground Speed								
Low Range = Large Diameter Sprocket High Range = Small Diameter Sprocket								
Number of Cells in Disk	Single Row Population (Seeds Per Acre)				Twin Row Population (Seeds Per Acre)			
	Low Range		High Range		Low Range		High Range	
	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
30	8000	37 000	21 000	98 000	16 000	74 000	42 000	196 000
40	11 000	49 000	27 000	131 000	22 000	98 000	54 000	262 000
45	12 000	55 000	31 000	147 000	24 000	110 000	62 000	294 000
48	13 000	59 000	33 000	157 000	26 000	118 000	66 000	314 000
50	13 000	61 000	34 000	164 000	26 000	122 000	68 000	328 000
64	17 000	78 000	43 000	210 000	34 000	156 000	86 000	420 000
90	23 000	111 000	61 000	295 000	46 000	222 000	122 000	590 000
108	28 000	133 000	73 000	355 000	56 000	266 000	146 000	710 000
Low Range and High Range sprockets generate population rates that overlap for a given ground speed.								
If ground speed is 8 km/h (5 mph) or slower and target population is within the low range rates shown in chart, use low range sprocket to avoid low motor speed warning.

Setting Single Set-Point Target Down Force

Setting Target Down Force

Select the down force target button (A) to open the target down force input screen.

Set target row unit down force by using the target down force input box (B) or the increase or decrease arrows (C).

When complete select enter (D).

Indicator arrows (E) are displayed as a visual indication that the system is increasing or decreasing pneumatic down force pressure.

Actual down force (F) is checked on a timed interval and automatically adjusted if necessary to match the target down force. If Actual down force (F) deviates below the target at an unacceptable rate, a warning appears in the warning message area (G) stating "Check pneumatic down force for leaks". Depending on the severity of the leak, the actual down force number (F) is highlighted orange or red.

Turning View Warning Suppression

A62927 —LUN—24JUL08

A—Headlands
B—Warning Suppression

C—Suppression Begins 45
Degrees Away

D—Suppression Ends 13 Degrees
Away

When operating with a John Deere™ GreenStar™ display and using John Deere™ Guidance Products, full screen seed monitor warnings can be suppressed (B) when making turns on headlands (A).

To enable turning view seed warning suppression, **Turning View** check box must be checked in GreenStar™2 Pro Guidance Setup.

The following occurs when turning view is enabled:

- Seed warning suppression and turning view begin when tractor is turned 45 degrees (C) away from the current pass using Straight Track.
- Turning View ends when tractor is within 13 degrees (D) of next pass.
- Seed warning suppression ends three seconds after turning view disappears from screen.
- Warnings are suppressed for a maximum of 22 seconds.

Headland Warning Suppression

Headland Warning Suppression ONLY suppresses the Rows Not Planting warnings when the height sensor or switch indicates that the planter frame is raised. It does not disable any other planter warnings.

To enable Headland Warning Suppression:

Select **Menu** >> **Planter** button >> **Configure** softkey >> **Sensor** tab

Place a check mark in Headland Warning Suppression box (E).

Remove check mark from box to disable Headland Warning Suppression.

On **Ground Driven planters without RowCommand™**, a height sensor **MUST** be installed and calibrated for Headland Warning Suppression to function. See your John Deere dealer.

Planters equipped with Variable Rate Drive and ground driven planters equipped with RowCommand™ have a height sensor installed.

SeedStar™ XP Main Run Screens

SeedStar™ XP Navigation Buttons

NOTE: This section explains the operation and features of the optional SeedStar™ XP monitoring system.

Refer to SeedStar™ 2 Main Run Screens section for basic monitor functions, Variable Rate Drive, and RowCommand™.

The SeedStar™ XP Navigation Buttons allow the operator to view detailed information for each SeedStar™ XP monitor function. Selecting each button displays graphical information in the Planter-at-a-Glance screen area and numerical information in the field to the right of the SeedStar™ XP Navigation Panel.

SeedStar™ Navigation Buttons turn orange when the monitored function nears the alarm limit and red when the monitored function goes outside of the alarm limit. This alerts the operator that a function is not performing optimally when the function is not selected for display. To adjust alarm set points, see ALARMS AND LIMITS SETUP PAGE in SeedStar™ XP SETUP Enhanced Monitor System section.

SeedStar™ XP buttons are:

- (A) Seed Population button. See SEED POPULATION in this section.
- (B) Seed Singulation button. See SEED SINGULATION in this section.
- (C) Seed Spacing CV button. See SEED SPACING COEFFICIENT OF VARIATION in this section.
- (D) SeedStar™ XP Screen Scan button. Selecting the button advances the displayed monitor page as follows.
 - Seed Population
 - Seed Singulation
 - Seed Spacing CV
 - Down Force
 - Ride Dynamics
- (E) Planters Details button. See PLANTER DETAILS in this section.
- (F) Row Details button. See ROW DETAILS in this section.
- (G) Ride Dynamics button. See RIDE DYNAMICS in this section.
- (H) Row Unit Down Force button. See DOWN FORCE in this section.

Seed Population

Select **Menu** >> **Planter** button.

When seed population button (A) is selected the seed population run screen is displayed.

The Seed Population main run screen displays seeding rate information for the planter. The Planter Main 1 (PM1) controller receives data from the seed sensors and uses tractor speed and implement width to calculate the seed rate.

Population at a Glance bar graph:

The line in the middle is the target population. When a row approaches the upper or lower alarm limit, the bar for that row turns orange and an audible alarm sounds along with a text message.

If a row falls below two seeds per second, the bar turns red and a row failed warning appears. If ground speed falls below 2 mph (3.2 km/hr), the planter monitor will not calculate population. Field Doc™ as-applied coverage maps will not be created during these conditions. The top of the graph is the programmed upper alarm limit. The bottom of the graph is the programmed lower alarm limit. Refer to SETUP Seed Rates section.

Seed Singulation

Select **Menu >> Planter** button.

NOTE: This feature is not available on planters with more than 48 rows.

When seed singulation button (A) is selected the seed singulation at a glance screen is displayed.

NOTE: Since singulation measurements are taken at the seed sensor, the appearance of the emerged crop may not be the same as the information displayed on the monitor. For example, seed roll and bounce in the furrow due to excessive ground speed causes spacing of emerged seed to appear worse than what the monitor indicated.

The Seed Singulation run screen provides the operator with information about the performance of each seed meter. The Planter Main 1 (PM1) controller measures the timing of the counts from the seed sensors at each row to determine whether they indicate a skip, multiple, or acceptable spacing, and displays the information on the GreenStar™ Display.

The center line of the Singulation at a Glance graph represents perfect singulation (zero skips and zero multiples). When the Singulation at a Glance bars are above the center line the percentage of doubles is increasing. When the Singulation at a Glance bars are below the center line the percentage of skips is increasing. Bars appear both above and below the center line when an improperly adjusted meter has doubles and skips.

To improve meter singulation performance, choose the correct seed disk for the crop being planted, adjust vacuum level, adjust double eliminator setting (if used), and use the correct amount of meter lubricant. Refer to your Rate Charts and Settings Manual for meter adjustments and recommendations.

Seed Spacing Coefficient of Variation

Select **Menu >> Planter** button.

NOTE: This feature is not available on planters with more than 48 rows.

When seed spacing coefficient of variation button (A) is selected the seed spacing coefficient of variation at a glance screen is displayed.

The Seed Spacing Coefficient of Variation (CV) run screen provides information about overall planter in-row seed spacing performance.

The Planter Main 1 (PM1) controller measures the consistency of the timing of the seed counts from the seed sensors to determine seed spacing performance for the planter. These spacing measurements are used to calculate the seed spacing coefficient of variation (CV) on a whole planter average and individual row basis.

NOTE: Coefficient of Variation (CV) measurements are only available for target seed rates below 40 seeds per second at 12.9 kph (8 mph). For example, CV information is only displayed for target seed rates less than 148 250 seeds/hectare on 76 cm rows (60 000 seeds/acre on 30 inch rows). For target seed rates above 40 seeds per second at 12.9 kph (8 mph), dashes (- -) are displayed in place of CV values.

Seed spacing coefficient of variation (CV) is defined as seed spacing standard deviation divided by the average spacing. Coefficient of Variation allows the operator to evaluate planter performance over a wide range of crops and target populations. Coefficient of variation is expressed as a decimal, with lower numbers indicating better in-row seed spacing.

Coefficient of Variation at a glance bars increase in height as seed spacing consistency gets worse. Maximum bar height indicates a Coefficient of Variation (CV) of 0.50. In typical planting conditions, operators expect coefficient of variation measurements to range from 0.10 to 0.30. CV values vary with different crops, seed disks, planting conditions, and ground speeds. Verify performance of planter seed spacing with in-ground population and spacing checks.

To improve overall planter seed spacing performance, ensure meter drives are operating properly, check meter

Menu

Seed Spacing Coefficient of Variation Button

A—Seed Spacing Coefficient of Variation Button

settings, adjust row unit down force, and reduce ground speed.

NOTE: Since CV measurements are taken at the seed sensor, the appearance of the emerged crop may not be the same as the information displayed on the monitor. For example, seed roll and bounce in the furrow due to excessive ground speed causes spacing of emerged seed to appear worse than what the monitor indicated..

Down Force Button (Active PDF Two Sensors)

A—Down Force Button

Select **Menu** >> **Planter** button.

When down force button (A) is selected, the down force at a glance screen is displayed.

The Down Force run screen displays average gauge wheel down force margin for each row unit equipped with a sensor node controller and gauge wheel down force sensor.

The gauge wheel down force sensor measures the amount of load that the gauge wheels are carrying as the row units move through the field. The load on the gauge wheels changes frequently when the planter is in motion and is displayed as margin on the display.

Down force margin is the amount of extra down force being applied to the row unit, over and above what is required for the opener disks to penetrate the soil and achieve full planting depth. The extra down force can come from the weight of the row unit and meter, weight of seed in the seed hoppers, the pneumatic down force system, or external down force springs.

IMPORTANT: Always perform and in field check BEFORE adjusting the target down force margin. Once depth and seed furrow has been verified, target margin can be adjusted accordingly.

A **target down force margin** must be entered based on the operator's judgment of planting conditions. Refer to

ALARMS AND LIMITS SETUP PAGE in SeedStar™ XP SETUP Enhanced Monitor System section. Set down force margin high enough to create a defined seed furrow but not so high that the side wall of the furrow is compacted.

High and Low Margin alarm set points are defined on the Alarms and Limits Setup Page. The margin alarm activates if the planter average down force margin goes above or below the target margin by the amount entered on the Alarms and Limits Setup Page.

The center line of the Down Force at a Glance chart is the **target margin**. Down Force at a Glance bars above the center line indicate down force margin above the target set point. Bars below the center line indicate down force margin below the target set point. If down force margin is consistently low on monitor screen, increase pneumatic row unit down force setting or reduce target margin set point based on your judgment of planting conditions and uniformity of seed depth. If down force margin is consistently high on monitor screen, decrease pneumatic row unit down force setting or increase target margin set point.

IMPORTANT: To ensure down force sensor accuracy, zero sensors annually or whenever sensors do not read 0 lbs. when planter is raised.

Continued on next page

OUO6064,00005ED -19-10NOV11-1/12

Set-Point Down Force system allows the operator to adjust the force in the air spring circuit manually through the display in the cab. Data from the air pressure sensor located in the air tank valve block is sent to the Planter Main 2 (PM2) controller and then displayed as down force on the monitor.

The operator selects a desired down force target that produces the most optimal seed furrow. When soil conditions change the operator can increase or decrease the pneumatic down force to maintain target margin, depth control, and avoid compacting the furrow.

Data from the row unit gauge wheel sensors is sent to the Planter Main 2 (PM2) controller and then displayed as down force margin on the monitor.

IMPORTANT: Always perform and in field check BEFORE adjusting the target down force margin.

Once depth and seed furrow has been verified, target margin can be adjusted accordingly.

OUO6064,00005ED -19-10NOV11-2/12

A72706 —UN—20SEP11

Active Down Force system automatically adjusts the force in the air spring circuit based on soil condition information gathered from the row unit gauge wheel sensors. Data from the row unit gauge wheel sensors is sent to the Planter Main 2 (PM2) controller and then displayed as down force margin on the monitor.

The operator selects a desired target margin (the amount of extra down force applied to the row unit, over and above what is required for the opener disks to penetrate the soil and achieve full planting depth). Active Down Force automatically monitors and adjusts the air pressure in the air springs to ensure that the actual margin is equal to the target margin. When soil conditions change, the active down force system automatically adjusts the down force to achieve the target margin.

IMPORTANT: Always perform and in field check BEFORE adjusting the target down force margin.

Once depth and seed furrow has been verified, target margin can be adjusted accordingly.

OUO6064,00005ED -19-10NOV11-3/12

A72708 —UN—21SEP11

Three requirements must be met for the Active Down Force system to function properly.

1. Sensor diagnostic check OK.
2. Wheel motion sensor active, the machine must be moving at a least 1.6 km/h (1 mph).
3. Machine must be lowered in the planting position.

Initially, the Active Down Force icon is empty. As the three requirements are met, the corresponding segments of the icon turn from blank to gray. After all the requirements are met, the entire icon will turn green, indicating that the PDF system is enabled, and active.

Ride Dynamics

Ride Dynamics

Select **Menu** >> **Planter** button >> **Ride Dynamics** button.

When ride dynamics button (A) is selected the ride dynamics at a glance screen is displayed.

The ride dynamics run screen displays row unit ride quality information for each row unit equipped with a sensor node controller. An accelerometer in each sensor node measures the severity of row unit movements.

Row Unit ride information is displayed as a percentage. 100% good ride represents optimum row unit ride quality and 0% represents the poorest ride quality. The Ride Quality at a Glance bars decrease in height as row unit ride gets worse.

Excessive row unit movement and bounce can affect meter performance, in-row seed spacing, and seed depth consistency.

To improve ride quality, reduce ground speed or increase row unit down force.

The ride quality alarm set point can be set on the Alarms and Limits Setup Page. Default value is 90 percent.

Zero Button

A59369 —UN—20FEB07

1. Select **Menu** >> **Planter** button >> **Totals** softkey >> **Totals** tab.

Screen Items:

- Two adjustable area counters
- A non-adjustable total area counter
- A non-adjustable seeding hours counter
- An average seeds per area counter
- An adjustable counter that counts down to zero before sounding an alarm

2. Select **Area Counter** one or two input box and enter zero to clear the counter or enter a value to continue a previous count.
3. Select **Area Until Empty** input box and enter an area to count down. When count reaches zero, a full page warning appears and an audible alarm sounds. Refer to SEED ESTIMATOR CALCULATORS to calculate the area a quantity of seed covers. Enter that value in the Area Until Empty input box. To set the alarm to sound before the hoppers are empty, enter a slightly smaller value than what the seed covers.

Continued on next page

OUO6064,00001D2 -19-30JUN10-1/2

4. **Seeding Hours** records the total amount of time seed is actually planted. **Seeding Hours** only counts when seed sensors detect seed flow.
5. Select the **Zero** button to clear Average Seeds Per Area counter every time a new field is entered or crop type is changed. This counter averages the total number of actual seeds detected by the seed sensors over the actual area planted.

Seed Estimator by Bag

IMPORTANT: Monitor must be completely set up for machine and rate configurations for calculators to function properly.

1. Select **Menu** >> **Planter** button >> **Totals** softkey >> **Calc** tab.
2. Select **Seed Estimator** in top drop down box.
3. Select **Calculated By** drop down box and choose **Bag**.
4. Select **Population** input box and enter target population.
5. Select **Seeds per Bag** input box and enter number of seeds in each seed bag.
6. Select **weight per bag** input box and enter weight of bag in units shown on screen.
7. Select **Bags:** input box and enter number of seed bags emptied into hoppers.
8. An approximate Area value is automatically calculated to show area until empty. Enter this value in **Totals** tab >> **Area Until Empty** input box to activate alarm. Enter a slightly smaller value to set alarm before hoppers are actually empty.

The lower area of screen is also used to calculate the number of seed bags needed for a given area.

1. Enter all preceding data accurately.
2. Select **Area** input box and enter the intended area to plant.
3. The approximate number of bags required to cover that much area is automatically calculated and displayed in **Bags:** box.

Variable-Rate Liquid Fertilizer

Variable Rate Fertilizer Overview

The variable rate fertilizer (VRF) system is monitored independently with the original GreenStar™ display or through the Original GreenStar™ Mode on the GreenStar™ display. To enter the Original GreenStar™ Mode, select **Menu >> Original GreenStar Monitor** button.

NOTE: Variable rate fertilizer does not work on competitive ISO 11783 compliant displays.

Warning messages do not appear on Original GreenStar Monitor screen. When an audible alert signals a warning, return to SeedStar™ 2 screens to view messages.

Variable Rate Fertilizer is comprised of three basic components.

1. An original GreenStar™ displays in Original GreenStar™ Mode.
2. A SeedStar™ Variable Rate Fertilizer controller mounted on the planter frame. This controller monitors pump rotational speed, piston stroke, ground speed, and distance traveled. Ground speed and distance are obtained from radar input.
3. A variable displacement piston pump for fertilizer.

The SeedStar™ Variable Rate Fertilizer system allows an operator to change the application rate from the cab while planting.

- Fertilizer rates are adjustable for different soil types or for irrigated versus dry land soils.
- Five different fertilizer rates are programmable into the system. While planting, the operator selects any one of the programmed rates to change the application.
- Two separate pumps are programmable for different rates.

A ground driven mechanism provides the power to rotate the pump. Once set, the programmed application rate is constant regardless of varying ground speeds.

Two pump output ranges are available. High and low ranges are determined using different sprocket combinations. Output rate is variable for either range.

Refer to your planter operator's manual for specific information about your model of planter pump and delivery system.

When a rate is selected, the controller monitors pump rotational speed, piston stroke, and distance traveled to calculate actual application rate. If calculated rate differs from selected rate, the controller adjusts the piston stroke to match selected rate. True ground speed is obtained with radar or GPS ground speed signal from the CAN bus. Implement speed is obtained indirectly from

*GreenStar is a trademark of Deere & Company
SeedStar is a trademark of Deere & Company*

Original GreenStar Monitor Button

pump rotational speed. The controller calculates percent slippage from the different speed readings and changes the pump stroke to compensate. If slippage exceeds a predetermined value, a warning is issued.

The following components must be active or engaged for proper system operation:

- Contact Drive or Ground Wheel Drive
- Radar or GPS Ground Speed Signal
- Pump RPM Sensor
- Pump Stroke Position Sensor

Fertilizer systems are available in two configurations; flow divider and central manifold.

- The flow divider is a device that controls product flow while maintaining constant pressure. The divider allows for maximum flexibility when changing application rates.
- The central manifold system allows some adjustment within overall system pressure limits. Orifices placed at each row control product flow. As rate is increased, pressure increases. Once pressure reaches a certain level, flow cannot be increased any further without damage to the system.

A variety of warnings and cautions are provided for customer awareness. Some examples are:

- No power detected on motor drive
- Over or under application!
- Pump position sensor not detected
- Pump 1 has no response to control
- VRF system problem detected. Pump Number 2 calculated rates inaccurate
- VRF system sprocket change detected. Pump Number 1 recalibrated
- Lost communications with mobile processor
- Battery voltage out of range

VRF System Test

This test verifies the operation of the position sensor and RPM sensor for variable rate fertilizer.

1. Select **INFO >> V.R. Liq Fert >> Diagnostics >> System Test**.

2. Select **Pump Direction** key until **INCREASE** is highlighted.

NOTE: Jog time is measured in milliseconds. 999 milliseconds is approximately one second.

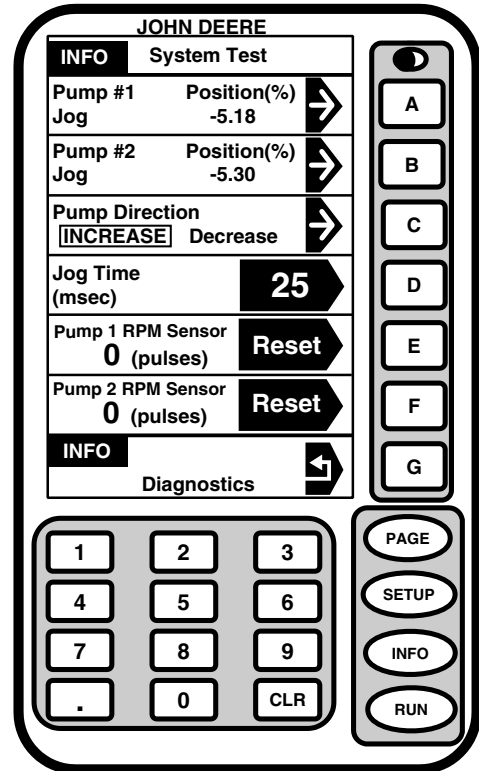

3. Select **Jog Time** key and enter 999.

NOTE: Each time the jog button is pressed the motor activates for one second.

4. Select **Pump Jog** key repeatedly until motor reaches upper limit and stops. Pump Jog Position percentage is 100 percent at upper limit.
5. Select **Pump Direction** key until **DECREASE** is highlighted.
6. Select **Pump Jog** repeatedly until motor reaches lower limit and stops. Pump Jog Position percentage is zero percent at lower limit.
7. Set pump direction to increase and select **Pump RPM Sensor** reset key.
8. Mark a position sensor sprocket tooth (A) and pump housing for reference.
9. Rotate contact drive tire until pump rotates 1 revolution (black line). 35 pulses equal a full revolution.

If RPM sensor does not record 35 pulses per sprocket revolution, adjust sensor (B) to within 2 mm (5/64 in.) of sprocket teeth. Perform the test again. If sensor does not record 35 pulses per revolution, replace sensor.

Warning Messages

WARNINGS are generated by the individual modules and Green Star Display alerting the operator to a serious condition or "situation" which has occurred of which the operator needs to be informed. Typically the operator should stop and rectify the "condition or situation" causing the WARNING before proceeding. WARNINGS are displayed as full page displays. The title displayed in the top display section is "WARNING". Examples of WARNINGS would be the indication of a planter row(s) not planting or ground speed at zero when planter is still planting (ground speed sensor failure detection). WARNINGS are the highest level of visual alarms presented to the operator. When a WARNING is cancelled without the "condition or situation" causing it being corrected, a caution is displayed on the bottom line of the display as a continued alert to the "situation". If more than one is occurring at the same time, key G can be used to toggle between WARNING alerts.

CAUTIONS are generated by the individual modules and Green Star Display alerting the operator to a function which is out of limits or a "situation" is or has occurred of which the operator needs to be informed. The caution message is displayed on line "G". Examples of CAUTIONs would be the indication of a planter row's population outside of the HI/LO range specified, or a low Hopper Level indication, or a "WARNING" for which the operator has acknowledged the "WARNING" reducing it to a CAUTION message, which is then displayed on line "G". CAUTIONs are the middle level of visual alarms presented to the operator.

Advisories are operator error messages displayed on line "G" telling the operator that an incorrect "action" has occurred such as entering a value which is out of the acceptable range for that constant. They are the lowest level of visual alarms presented to the operator.

OUO6074,0000688 -19-01NOV07-1/1

Variable Rate Fertilizer Warnings

WARNING: Over Application!

NOTE: This warning will be followed by a "Over Application! Pump #1 at min. setting." caution on line "G".

This warning is issued if the pump adjusts to its lowest setting and is still overapplying. The large sprocket should be installed to change the pump speed range or a higher rate should be selected. There is a caution associated with this warning. When the warning is cleared there is a caution issued.

Screen Area Information

Over Application! Pump #1 is at the minimum setting.
— Over Application! Pump Number 1 is at the minimum setting.

Manual Override

In the event of an electronic system failure, the pump may be manually set and locked to provide a fixed application rate. This feature allows the operator to continue applying product at a fixed rate.

1. Determine pump setting from fertilizer rate chart in implement operator's manual.
2. Disconnect position sensor harness (A) and motor harness (B).
3. Remove cover (C).
4. Remove lock nut (D) and small sprocket (E).
5. Store cover, lock nut and small sprocket in a safe place until repairs can be made and parts reinstalled.

NOTE: If pump is already in lock down mode, lock down bracket (F) will have to be loosened.

6. Rotate large gear (G) fully counter clockwise. Full counter clockwise position is pump setting "2".
7. Sight along bracket corner (H) and mark the tooth in closest alignment with a "2".
8. Count the number of teeth that pass bracket corner (H) as sprocket is rotated clockwise. See table for the number of teeth which represent pump setting numbers. The numbers may be marked on the sprocket, if desired.
9. Once setting is achieved, loosen cap screw (I) on lock down bracket (F) and rotate bracket into position so it engages sprocket teeth and locks sprocket into position. Tighten lock down bracket.

Pump Settings Represented by Number of Teeth Past the Zero Alignment Point

Pump Setting Number	Number of Teeth
Pump Setting 2	0 Teeth Fully Counterclockwise

Liquid Fertilizer Sensor Diagnostics

1. Turn tractor OFF. Turn key to accessory position.
2. Ensure that sensor wiring is properly connected.

If only one sensor is used, it MUST be connected to wire labeled LEFT FERT.

3. Ensure that correct number of sensors are selected.

Select **Planter** button >> **Planter Configuration** softkey >> **Sensors** tab >> **Fertilizer** drop down >> **Sensors** drop down. Enter number of sensors on machine.

4. Ensure that sensors are calibrated and zeroed correctly.

- Enter sensor calibration number of 37.5 for each sensor in calibration input box.
- Release trapped pressure in fertilizer manifold, then press ZERO button for each sensor.

5. Ensure that voltages are correct.

Select **Planter** button >> **Diagnostics** softkey >> **Readings** tab >> **System Voltages** drop down.

- Controller voltage MUST be 11 V or higher.
- Sensor supply value is 8.0 V.
- If voltage is ZERO, check wiring.

Warning Screens

Turning View Warning Suppression

A—Headlands
B—Warning Suppression

C—Suppression Begins 45
Degrees Away

D—Suppression Ends 13 Degrees
Away

When operating with a John Deere™ GreenStar™ display and using John Deere™ Guidance Products, full screen seed monitor warnings can be suppressed (B) when making turns on headlands (A).

To enable turning view seed warning suppression, **Turning View** check box must be checked in Greenstar™2 Pro Guidance Setup.

The following occurs when turning view is enabled:

- Seed warning suppression and turning view begin when tractor is turned 45 degrees (C) away from the current pass using Straight Track.
- Turning View ends when tractor is within 13 degrees (D) of next pass.
- Seed warning suppression ends three seconds after turning view disappears from screen.
- Warnings are suppressed for a maximum of 22 seconds.

OUO6064,00001FB -19-09JUL10-1/1

Warning Messages

WARNINGS are the highest level of an alert. Warnings alert the operator to a serious condition. It is recommended the condition causing a warning be corrected before proceeding further. Warnings are displayed as full page messages. Rows not planting is an example of a warning. If a warning is canceled without the condition corrected, a caution is displayed on the bottom line of display as a continued alert. If more than one alert occurs at the same time, a toggle button appears so the operator is able to scroll through alerts.

IMPORTANT: Full page warnings will occur when not on main Planter RUN page to ensure that operator is aware of the issue.

IMPORTANT: When a planter run screen is visible on the display, warning screens will be contained to the portion of the screen the planter occupies. Full screen warnings will occur when a planter RUN screen is not visible on the Display to ensure that the operator is aware of the issue.

A61394 —UN—19NOV07

OUO6064,0000204 -19-20JUL10-1/3

CAUTIONS are the medium level alert. Cautions alert the operator to conditions that are out of operational limits, but are not serious enough to stop. A population outside of the upper or lower limit is an example of a caution. A warning that has been cleared without correction also appears as a caution. Once a full page caution is cleared, the message remains on a single line at the bottom of the screen until corrected. If more than one alert occurs at the same time, a toggle button appears so the operator is able to scroll through alerts.

IMPORTANT: When a planter run screen is visible on the display, caution screens will be contained to the portion of the screen the planter occupies. Full screen cautions will occur when a planter RUN screen is not visible on the Display to ensure that the operator is aware of the issue.

OUO6064,0000204 -19-20JUL10-2/3

Warning Screens

Advisories are the lowest level alert. An advisory alerts the operator to valuable information that is not serious or outside a limit. When a specified target area has been met, an advisory is issued. If more than one alert occurs at the same time, a toggle button appears so the operator is able to scroll through alerts.

Integrated Pneumatic Down Force

Service Machine Safely

To help prevent personal injury caused by unexpected movement, be sure to service machine on level surface.

If machine is connected to tractor, engage parking brake and/or place transmission in "PARK", shut off engine and remove key.

If machine is detached from tractor, block wheels and use safety stands to prevent movement.

TS230 —UN—24MAY89

OM63945A,05F -19-20OCT98-1/1

Pneumatic Down Force

Properly Rolled Air Spring

Improperly Rolled Air Spring

CAUTION: Avoid serious injury from exploding parts due to over-pressurization or operating the system without all components in place.

- Do not inflate air springs above 827 kPa (8.2 bar) (120 psi) air pressure or 1779 N (400 lb.) down force.
- Do not remove pressure relief valve.
- Do not pressurize system unless all row unit components are in place.

IMPORTANT: Avoid kinks in air spring. Do not lower machine with zero air pressure in the system. Maintain 34—55 kPa (0.3—0.5 bar) (5—8 psi) air pressure or 76—120 N (17—27 lb.) down force in the system. If air spring kinks, raise machine and pressurize the system until air springs straighten out.

Do not operate with a pinched or unrolled air spring. Lower system pressure to roll air springs by hand. Roll air spring over lower piston. Incremental lowering of machine is required to start air spring rolling over lower piston.

NOTE: It is normal for system air pressure to drop when frame is raised and increase when frame is lowered.

NOTE: If more down force is needed on row units that follow in tractor tire tracks, install an extra single down force spring on these row units. See your John Deere™ dealer for more information.

1. Ensure handle (B) (if equipped) is horizontal when operating planter.
2. If compressor system fails, charge the air spring circuit at fill valve (A) with shop air.
3. If down force control system fails, use manual overrides (C) to increase or decrease air spring

John Deere is a trademark of Deere & Company

C—Manual Overrides
D—Tank Gauge

pressure. Check air spring pressure with a tire pressure gauge at fill valve (A).

Tank gauge (D) displays pressure in tank not pressure in air springs. Normal operating range for tank pressure is 790—1000 kPa (7.9—10 bar) (115—145 psi)

For more information, see your SeedStar™ Monitor Operators Manual.

Pressurize Pneumatic Down Force System

Improperly Rolled Air Spring (Twin Row Planters)

A66835 —UN—25MAR10

- To fill the planters down force air springs for the first time after removing from storage:
 - In Auto mode, system begins filling the air springs to achieve the target margin when lowered to planting position.
 - In Set-Point mode, system begins filling the air springs to achieve the target down force when lowered to planting position.

- Pressurize system to a minimum of 16 kg (35 lb.) of down force displayed on monitor or approximately 83 kPa (0.8 bar) (12 psi) on gauge.
- Minimum down force during operation is 16 kg (35 lb.) displayed on monitor or approximately 103 kPa (1.0 bar) (15 psi) on gauge. Failure to maintain this pressure can result in damage to air springs.

OUC6064,0000612 -19-10NOV11-1/1

Depressurize Single Rank Pneumatic Down Force System

NOTE: Location and orientation of air reservoir varies based on planter model. Procedure is similar for all models.

1. Lower planter to planting position.
2. On SeedStar™ monitor, reduce down force pressure to 66 N (15 lb.).
3. Ensure handle (B) is in position shown.
4. Press manual override button (A) to release residual air pressure from air spring circuit.

Clean or Replace Electric Air Compressor Filter

IMPORTANT: Filter cleanliness is critical to maintain the performance and service life of the air compressor. Clean or replace the air filter element yearly or at the beginning of each season.

1. Remove and retain wing nut and seal washer (A).
2. Remove weather shield (B) and filter element (C).
3. Wipe dust from filter base.
4. Replace filter and weather shield.
5. Reinstall seal washer, tighten wing nut.

SeedStar™ 2 Diagnostics

Controller Hardware, Software, and Part Number Identification

There are separate hardware and software versions for the display and each controller. Use the version to identify machine controllers for your dealer. Keep both the display and planter controller(s) updated with the latest software version for best performance and latest features. Software updates are only available through your John Deere™ dealer.

Select **Menu** >> **Planter** Button >> **Diagnostic** softkey >> **Readings** tab.

Select **Hardware / Software** from top drop down box.

Select **Main** or **Auxiliary** from second drop down box to view data from each controller. Auxiliary is only an option if there is more than one controller installed on the machine.

- Hardware serial number and part number are displayed.
- Serial number is also on a tag (A) attached to controller.
- Software part number and version number are displayed.
- Total hour meter for controller is at bottom of screen.

Vacuum Sensor

Use this to verify proper sensor connection and calibration.

1. Verify vacuum wiring is properly connected.

If only one vacuum sensor is used, it **MUST** be connected to LEFT VAC wire.

2. Verify vacuum hose is properly connected.

Connect hose to P2 port (A).

3. Check for air leaks in hose between sensor and vacuum meter.

4. Turn tractor OFF. Turn key to ACC (Accessory).

5. Verify correct number of vacuum sensors are configured.

Select **Menu** >> **Planter** button >> **Configuration** softkey >> **Sensor** tab >> **Vacuum** drop down.

Number of Sensors selected must match number of sensors on machine.

6. Select **Sensor** drop down and select each sensor one at a time. Select **Cal Value** and enter 5.66 (English units) or 143.76 (Metric units).

7. Select each sensor one at a time and select **Zero Sensor** button.

8. Verify voltages are correct.

Select **Diagnostic** softkey >> **Readings** tab >> **System Voltages** drop down.

- Controller Input value **MUST** be 11 vdc or higher.
- Vacuum Sensor Supply value is 8.0 vdc.
- If voltage is ZERO, check wiring.

SeedStar™ 2 Diagnostics for Variable Rate Drive

Rotate Seed Meters

Use this to verify drillshaft and meters turn without pulling machine through a field. Planter remains stationary during this test.

1. Select **Menu** >> **Planter** button >> **Diagnostics** softkey >> **Tests** tab.
2. Select **Rotate Meters** from drop down box.
3. Select **Motor Selection** input box and select All or any single motor to rotate.
4. The following must occur for this feature to function:
 - Planter must be unfolded.
 - Planter must be in raised position.
 - Planter must be stationary.
 - Variable rate hydraulics must be active.

Select **Meter Rotation** button. An audible tone sounds when meters stop turning. Each time the icon is pressed, the meters rotate approximately one half a revolution. If meters fail to move, a warning screen appears.

Rotate Seed Meter function can be accessed from the planter main Run page.

Variable Rate Drive Component Activity

The Variable Rate Drive Data Screen is the single best source to diagnose VRD problems. The following must occur for the VRD system to operate.

- A target population must be entered and turned "ON".
- VRD hydraulics must be flowing continuously at highest flow rate.
- Planter must be unfolded and lowered to planting height.
- Height sensor must be calibrated and "Planter Position" must indicate "Down".
- Planter must be moving forward at planting speed.
- "Ground Speed" must indicate a ground speed.
- "Wheel Sensor" must indicate "Active".

NOTE: If Target RPM displays CAL, operate machine in the field a short distance with VRD active. This calibrates motors.

1. Select **Menu** >> **Planter** button >> **Diagnostics** softkey >> **Readings** tab.
2. Select **VRD Data** from drop down box.

The status and activity for VRD components is shown.

Ride Dynamics Sensor Diagnostics

IMPORTANT: Remove system power before disconnecting sensor node harness.

This screen is used to monitor ride dynamics sensor data for all rows on one screen.

1. Select **Menu** >> **Planter** button >> **Diagnostics** softkey >> **Readings** tab.
2. Select **Ride Dynamics** from drop down box.

The percentage for ride quality sensors on the machine are shown. If the sensor is present but no data is being received, dashes "-" are displayed.

Diagnostics Code

Diagnostics Codes should only be accessed by a trained technician. Refer to your John Deere dealer.

OUO6064,000021E -19-21JUL10-1/1

Troubleshooting

SeedStar™ 2 and SeedStar™ XP Troubleshooting

The SeedStar™ 2 and SeedStar™ XP monitoring system is equipped with a variety of self tests, diagnostic screens, diagnostic tests, and Caution and Warning Screens to help operators and dealer technicians locate the cause of a potential problem.

Familiarize yourself with the warning screens (see Warning Screens section in this manual) and diagnostics (see Diagnostics section in this manual) and perform the basic troubleshooting steps in this section before calling your John Deere™ dealer.

OUO6064,0000220 -19-29JUL10-1/1

Troubleshoot GreenStar™ Display

Symptom	Problem	Solution
Screen not readable.	Contrast incorrectly set.	Adjust contrast.
	Screen backlight set too low.	Increase backlight adjustment.
Incorrect speed displayed.	Incorrect calibration.	Enter correct radar calibration value or recalibrate on 122 m (400 ft.) course.
	Incorrect units of measure set.	Set correct units.
	Speed reading erratic.	Radar mount loose or vibrates.
No radar speed reading.	No calibration value entered.	Calibrate radar.
	Windy or dusty conditions.	Change to a different speed source.
No radar calibration value.	Display installed on 7000/8000/9000 Series or newer tractor with factory installed radar.	Calibrate radar per tractor operator's manual.

OUO6074,000106C -19-11OCT07-1/1

Troubleshoot SeedStar™ 2

Symptom	Problem	Solution
Planter icon does not appear on main menu.	Controller are not communicating on CAN bus.	Select main menu, select message center button, select CONTROL UNIT INFO button. Select implement CAN from drop-down box. Search for Control Unit PM1 (0xC0) and PA1 (0xC1). If you cannot find any of these addresses, the planter controllers are not communicating on the CAN bus. Check ECU power, ECU ground, CAN high, and CAN low at the 9-pin connector on back of tractor and planter controllers. (Use Service Advisor to find the pin locations for these connections)
Warning: Verify power on pins 1 and 3.	Machine not equipped with variable rate drive.	If machine is not equipped with VRD, change drive source. (See CONFIGURE PLANTER DRIVE SOURCE in SETUP Basic Planter Configuration section.)
	Machine is equipped with variable rate drive.	Check pins 1 and 3 for 12 volt power at ISO coupler.
No vacuum reading.	Faulty wire connection.	Check wiring harness and repair.
	Vacuum blower not running.	Start vacuum blower motor.
	Vacuum line on wrong fitting on sensor.	Install vacuum line to sensor P2 fitting.
	Incorrect planter configuration.	Enter correct number of vacuum sensors. (See VACUUM SENSORS in SETUP Basic Planter Configuration section.)
	Vacuum section not displayed on RUN screen.	Enter correct number of vacuum sensors. (See VACUUM SENSORS in SETUP Basic Planter Configuration section.)
	Sensor connected to wrong wire harness lead.	If only one vacuum sensor is used, correct to wire labeled LEFT VACUUM.
Wrong vacuum reading.	Vacuum sensor not calibrated.	Stop vacuum blower motor and zero the sensor. (See VACUUM SENSORS in SETUP Basic Planter Configuration section.)
	Wrong calibration value.	Enter correct calibration value 5.66 (English units) or 143.76 (Metric units). (See VACUUM SENSOR in Diagnostics section.)

Continued on next page

OUC6064,000018B -19-29JUL10-1/4

Symptom	Problem	Solution
No high or low population reading.	Faulty vacuum sensor.	Replace sensor.
	Dirty seed tube sensors.	Clean sensors. (See Seed Tube Sensors section.)
	No radar speed.	Connect and calibrate radar or other speed source.
	Seed sensors turned off.	Turn split row option off. (See CONFIGURE FRAME, SPLIT ROW, AND DRIVE DISCONNECT WARNING in SETUP Basic Planter Configuration section.)
		Turn rows on. (See SEED SENSORS ON/OFF in SETUP Basic Planter Configuration section.)
Wrong population reading.	Faulty wire harness connection.	Check wiring harness connections.
		Correct wire harness connection. See Technical Manual TM111219.
	Dirty seed tube sensors.	Clean sensors. (See Seed Tube Sensors section.)
	Row spacing incorrect.	Enter correct row spacing. (See CONFIGURE FRAME, SPLIT ROW, AND DRIVE DISCONNECT WARNING in SETUP Basic Planter Configuration section.)
	Speed reading incorrect.	Enter correct radar calibration or troubleshoot radar.
	Windy or dusty conditions.	Change to a speed source other than radar. (See GROUND SPEED SOURCE in SETUP Basic Planter Configuration section.)
	Wrong units of measure.	Enter correct units. (See CONFIGURE LANGUAGE AND UNITS OF MEASURE in Monitor Settings section.)
	Speed reading too high.	See wrong speed reading above.
	Planting seed at a rate exceeding sensor capability.	Install AccuCount™ sensors or use Population Adjust.
	Planting Hill-Drop cotton.	Multiple seeds pass seed sensor at one time.

Continued on next page

OUC6064,000018B -19-29JUL10-2/4

Symptom	Problem	Solution
Row failure warning.	Population Adjust value set incorrectly.	Verify actual field planting population. Compare to population reading. Adjust Population Adjust setting as needed.
	Meter not planting.	Seed hopper empty, fill with seed.
	Harness problem.	Inspect harness and connections.
	Planting in rocky conditions.	Seeds knocked off disk, adjust row unit down force.
	Dirty seed tube sensors.	Clean sensors. (See Seed Tube Sensors section.)
Wrong area reading.	CCS system plugging or bridging.	Clear plug or bridge. Refer to planter operator's manual. Adjust CCS pressure as required.
	Planter width incorrect.	Enter correct planter width. (See CONFIGURE FRAME, SPLIT ROW, AND DRIVE DISCONNECT WARNING in SETUP Basic Planter Configuration section.)
	Half-width or third-width disconnect on.	Select "Reduce Area by these Rows" when using disconnect feature.
No planter monitor reading.	Radar problem.	Correct radar calibration or troubleshoot radar.
	Electrical connections not correct.	Check fuses in tractor. Check connections on back of rear tractor connector.
No liquid fertilizer reading.	There is no pressure.	Drive planter forward and verify pump is primed.
	Incorrect planter options.	Enter correct number of fertilizer sensors. (See LIQUID FERTILIZER SENSORS in SETUP Basic Planter Configuration.)
	Sensor connected to wrong wire harness lead.	If only one liquid sensor is used, it must be connected to wire labeled LEFT FERT.
	Faulty wire connection.	Check wiring harness and repair.
Wrong liquid fertilizer reading.	Wrong calibration value.	Enter calibration value 37.50 (English units) or 258.55 (Metric units). (See LIQUID FERTILIZER SENSOR in Diagnostics section.)

Continued on next page

OUC6064,000018B -19-29JUL10-3/4

Troubleshooting

Symptom	Problem	Solution
	Erroneous ZERO value.	Relieve trapped pressure in fertilizer manifold. ZERO sensor. (See LIQUID FERTILIZER SENSORS in SETUP Basic Planter Configuration section.)
	Faulty liquid fertilizer sensor.	Replace sensor.
	Sensor plugged.	Remove sensor and flush with warm water. Do NOT insert hard object into sensor when cleaning. Sensing unit may be damaged.

OUO6064,000018B -19-29JUL10-4/4

Troubleshoot Variable Rate Drive

Symptom	Problem	Solution
<p>Warning: Verify power on pins 1 and 3.</p> <p>WARNING SCREEN: Motor 1, 2 disabled. Drive failed to respond. Verify hydraulic power. Check operator's manual.</p> <p><i>NOTE: This warning occurs when motor speed should be greater than 18 rpm and the motors are currently not turning.</i></p>	No 12 volt power on ISO coupler pins 1 and 3.	Check pins 1 and 3 for 12 volt power.
	No hydraulic pressure or flow.	<p>Make sure hoses are correctly plugged into tractor SCV or power beyond.</p> <p>Verify correct location of pressure and return lines. A one way check valve is installed in the return line hose tip.</p> <p>Set tractor SCV time to continuous detent and flow. (See MAKING PROPER HOSE CONNECTIONS in the ATTACH AND DETACH VARIABLE RATE DRIVE section.)</p> <p>Activate tractor SCV.</p>
	Low hydraulic pressure or flow to variable drive motors.	<p>Maintain full tractor engine rpm.</p> <p>Increase tractor SCV flow setting.</p> <p>Minimize flow to other hydraulic functions.</p> <p>Verify tractor hydraulic system performance.</p>
	No motor speed detected by variable drive controller.	<p>Verify motor speed sensor electrical connections. Note: If this condition exists, the motor without any speed sensor feedback will rotate at a very high RPM for several seconds before full page warning is issued.</p> <p>Verify set screw in motor coupler is tightened to motor speed shaft.</p> <p>Verify hydraulic valve electrical connection.</p>
	Mechanical binding causing high torque.	<p>Wing to mainframe drive shaft couplers misaligned. Align drive shaft couplers.</p> <p>Failed drive shaft support bearings. Replace failed bearings.</p> <p>Misaligned seed meter and/or chemical hopper disconnects. Inspect and adjust seed meter and/or chemical hopper disconnects.</p> <p>Identify and repair any other sources of mechanical binding.</p>

OUC6074,000106E -19-13MAR09-3/8

Symptom	Problem	Solution
Seed rate selection line appears black with white lettering.	Motor speed sensor detects no motion/motors are not turning.	Check connection to speed sensor.
	Faulty motor speed sensor.	Replace motor speed sensor.
	Seal blown in motor.	See your John Deere dealer.
	Hose clamps on motor speed sensor coupler loose.	Tighten clamps.
WARNING SCREEN: STOP. Power Interruption. Possible skip.	Valve on hydraulic motor not getting any power.	Check connection to valve.
	Electrical power lost to controller.	Check connection of 30-way METRAPAK™ connector on controller.
		Check 9-pin connector.
		Check 3-pin convenience outlet connector.
WARNING SCREEN: No Tractor Speed, Planter Moving. WARNING SCREEN: Tractor/Planter Speed Error. <i>NOTE: This warning occurs when radar speed is significantly different from planter motion sensor speed.</i> <i>Extremely windy, dusty conditions will give radar false readings and cause this warning.</i> <i>Excessive wheel slippage on tire with motion sensor mounted to it, will cause this warning.</i>		See your John Deere dealer.
	The radar signal has been lost for a period of three seconds.	Verify radar connection.
	Faulty radar.	Verify radar connection.
		Consult dealer or technical manual for further diagnostics.
		Verify motion sensor connection.
		Verify motion sensor-to-disk clearance is 2—4 mm (0.08—0.16 in.) and wheel bearing is tight. Verify wheel is turning.
		Consult dealer or technical manual for further diagnostics.
No row failed warnings from planter monitor when drive motors stop.	Normal condition for planter monitor not to issue row failed warning below two mph.	Operate planter above two mph.

Continued on next page

OUC6074,000106E -19-13MAR09-4/8

Symptom	Problem	Solution
Hydraulic motors do not turn or stop turning.	Normal condition when ground speed is less than one mph under all conditions/setup. Depending on variable drive setup, the minimum speed the system will function at may be higher. Note: Planter monitor will not provide row failure warning under 3 km/h (2 mph).	Operate planter at ground speeds greater than minimum ground speed.
	A population of zero has been selected.	Population set rate must be greater than zero.
	No hydraulic pressure or flow.	<p>Make sure hoses are correctly plugged into tractor SCV or power beyond.</p> <p>Verify correct location of pressure and return lines. A one way check valve is installed in the return line hose tip.</p> <p>Set tractor SCV to continuous flow.</p> <p>Activate tractor SCV.</p>
	Low hydraulic pressure/flow to variable drive motors.	<p>Maintain full tractor engine RPM.</p> <p>Increase tractor SCV flow setting.</p> <p>Minimize flow to other hydraulic functions.</p> <p>Verify tractor hydraulic system performance.</p>
	Height sensor not calibrated.	Calibrate height sensor. (See height sensor calibration in SETUP Variable Rate Drive section.)
	Height sensor STOP position set too low (drawn machines).	Set height sensor STOP position at a frame height that allows the row unit opener blades to just touch the ground. If the stop position is set too low, the drive motors may turn on/off while planting due to wheel module float over rough ground conditions.
	Height sensor bracket not adjusted to specification (integral machines).	Adjust height switches. (See ADJUST PARALLEL ARM HEIGHT SWITCH in SETUP Variable Rate Drive section.)

Continued on next page

OUO6074,000106E -19-13MAR09-5/8

Symptom	Problem	Solution
	Planter motion sensor not active when planter is moving.	<p>Verify motion sensor is active when planter is operating. (See VARIABLE RATE DRIVE COMPONENT ACTIVITY in Diagnostics section.)</p> <p>Verify electrical connections to motion sensor.</p> <p>Check 2 mm (0.08 in.) gap between motion sensor and tone wheel bolted to the wheel.</p> <p>Wheel bearings may be loose or failed causing an increasing/decreasing gap on wheel motion sensor.</p>
	Mechanical binding causing high torque.	<p>Wing to mainframe drive shaft couplers misaligned. Align drive shaft couplers.</p> <p>Failed drive shaft support bearings. Replace failed bearings.</p> <p>Misaligned seed meter and/or chemical hopper disconnects. Inspect and adjust seed meter and/or chemical hopper disconnects.</p> <p>Identify and repair any other sources of mechanical binding.</p>
Hydraulic motor(s) continue to turn when planter is raised.	Motor proportional valve stuck from hydraulic oil contamination.	<p>Perform flush motor procedure.</p> <p>Consult dealer or Technical Manual for proportional valve cleaning procedure.</p> <p>Replace hydraulic oil and oil filters in tractor.</p>
Only one hydraulic motor of a two hydraulic motor system is turning.	<p>Half width disconnect OPEN on either left or right side.</p> <p>Variable drive setup for only one motor. This condition will only engage the right hand side of the machine.</p>	<p>Close half width disconnect switch.</p> <p>Set number of hydraulic motors to two. (See ASSIGN MOTOR—ROWS, SPROCKETS, AND WIDTH DISCONNECT in SETUP Variable Rate Drive section.)</p>
Motors turning backwards.	<p>Full tractor pressure is being applied to the "T" port on the hydraulic valve manifold.</p> <p>Motor orientation on planter backwards.</p> <p>Valve manifold orientation on motor backwards.</p>	<p>Plumb hydraulic lines so hydraulic pressure is applied to the port labeled "P".</p> <p>See installation instructions for correct orientation.</p> <p>See installation instructions for correct orientation.</p>

Continued on next page

OUC6074,000106E -19-13MAR09-6/8

Symptom	Problem	Solution
Hydraulic motors turn at an erratic speed.	Proportional valve contaminated.	Perform hydraulic motor/valve flush. (See VRD MOTOR/VALVE FLUSH in Diagnostics section.)
	Low hydraulic pressure/flow to variable drive motors.	Maintain full tractor engine rpm. Increase tractor SCV flow setting. Minimize flow to other hydraulic functions. Verify tractor hydraulic system performance.
	Mechanical binding causing torque/speed fluctuations.	Loose chain on drive system causing chain to jump sprocket teeth. Tighten chain idler. Misaligned chains causing chain to jump sprocket teeth. Align drive and driven sprockets. Align chain idler. Wing to mainframe drive shaft couplers misaligned. Align drive shaft couplers. Failed drive shaft support bearings. Replace failed bearings. Misaligned seed meter and/or chemical hopper disconnects. Inspect and adjust seed meter and/or chemical hopper disconnects. Identify and repair any other sources of mechanical binding.
	Motors are not designed to operate less than 18 rpm. For motors to operate above 18 rpm, the ground speed must be above the minimum. The minimum ground speed varies depending on SETUP.	Operate planter above minimum ground speed.
When starting to plant from a stopped position, hydraulic motor(s) do not turn for a brief period. This creates a seeding gap in the field.	Normal operation to have an approximate 0.9 m (3 ft) seeding gap using Quick Start or a 9 m (10 ft) skip without Quick Start.	Lower planter a short distance ahead of where seed must reach the ground. This may require backing up, if planter is stopped in the middle of the field. Do not back up while planter is lowered.
	<i>NOTE: These approximate distances will be longer if seed is not loaded on the seed meter disk.</i>	Use Quick Start feature to minimize skip. Load seed on the seed meter disk prior to the start of productive seeding by lowering the planter into the DOWN position and driving forward with the vacuum on if required.

Continued on next page

OUC6074,000106E -19-13MAR09-7/8

Symptom	Problem	Solution
		When using Quick Start, begin forward travel in a low gear to take off slower. By taking off slow and then shifting gear to speed up, the skip becomes smaller.
Many seeds on end of row when stopping abruptly.	VRD system requires a brief delay to shut off.	Start downshifting prior to end of row to reduce forward travel speed prior to stopping at end. This will allow VRD system more time to slow down and reduce the amount of seeds dropped at end when planter is stopped.
Set population does not match monitored population.	Vacuum set too low/high.	Adjust vacuum to appropriate level.
	Problem with seed meter.	See operator manual for troubleshooting solutions.
	Wrong seed disk selected in variable drive setup.	Enter correct seed disk or meter. (See VRD MACHINES—CONFIGURE METER, CROP, DISK, AND RATES in SETUP Seed Rates section.)
	Wrong sprocket combination selected in variable drive setup.	Enter correct sprocket combination. (See ASSIGN MOTOR—ROWS, SPROCKETS, AND WIDTH DISCONNECT in SETUP Variable Rate Drive section.)
	Wrong row spacing.	Enter correct row spacing. (See CONFIGURE FRAME, SPLIT ROW, AND DRIVE DISCONNECT WARNING in SETUP Basic Planter Configuration section.)
	Wrong units of measure.	Enter correct units. (See CONFIGURE LANGUAGE AND UNITS OF MEASURE in Monitor Settings section.)
	Wrong row unit type selected.	Select correct row unit type. (See SET METER TYPE AND ROW UNIT DRIVE TYPE in SETUP Variable Rate Drive section.)
	Seed sensors can not count seeds passing through sensors at high rates.	Normal operation of planter monitor. (See POPULATION ADJUST in the SETUP Seed Rates section.)
Wrong seed population based on seed used/acre but selected rate and planter monitor agree.	Radar not calibrated.	Calibrate radar. (See RADAR CALIBRATION in Performance Monitor section.)

OUO6074,000106E -19-13MAR09-8/8

Symptom	Problem	Solution
Calculated acres do not match actual acreage.	Machine width not correct in planter monitor setup.	Verify machine width. (See CONFIGURE FRAME, SPLIT ROW, AND DRIVE DISCONNECT WARNING in SETUP Basic Planter Configuration section.)
	When row failed warning was issued, seed sensors were ignored and machine width reduced.	This is a normal planter monitor mode selected by the operator. This is a temporary condition that resets when ground speed is reduced below 3 km/h (2 mph) then increases above 3 km/h (2 mph).
	Radar not calibrated.	Calibrate radar. (See RADAR CALIBRATION in Performance Monitor section.)
Radar speed displayed on GreenStar™ display different than tractor performance monitor/corner post display.	Either the GreenStar™ display or tractor performance monitor/corner post display not calibrated for radar.	Calibrate radar. (See RADAR CALIBRATION in Performance Monitor section.) See tractor operators manual to calibrate tractor performance monitor/corner post display.

OUC6074,000106E -19-13MAR09-9/8

Troubleshoot RowCommand™

Symptom	Problem	Solution
<p>Caution: No CAN Bus communications with Electronic Power Modules (EPM). Some row clutches will not disengage.</p> <p>Check Connections. A restart is required to attempt communications with EPMS.</p>	EPM is off line and not communicating with controller.	<p>Check all connections on EPM that is not communicating.</p> <p>See your John Deere dealer.</p>
<p>Caution: Electronic Power Modules (EPM) are not responding to CAN Bus commands. Some row clutches will not disengage.</p> <p>Check connections. Troubleshoot SeedStar™ XP

IMPORTANT: Remove system power before disconnecting sensor node harness.

Symptom	Problem	Solution
Gauge wheel load sensor circuit error.	Sensor node controller on the rows listed has detected an open circuit or short circuit in the gauge wheel load sensor circuit.	Check wiring harness and electrical connectors from gauge wheel load sensor to sensor node controller. See your John Deere™ dealer.
Seed Singulation percentage low.	Meter not adjusted properly.	Refer to Rate Charts and Settings Manual. Confirm correct disk type and vacuum level for seed being used. Confirm brush type and meter hub adjustment. Confirm correct talc usage and mixing. Check and adjust double eliminator setting (if used).
	Excessive ground speed.	Increase row unit down force first. If singulation does not improve, reduce ground speed.
	Excessive row unit dynamics (bounce).	Increase row unit down force first. If singulation does not improve, reduce ground speed.
	Erratic Drive line Operation.	Check meter drive line. Check chains, bearings, drill shaft bearings, drill shaft couplers for proper alignment, lubrication, and smooth operation. Refer to planter operator's manual.
	Alarm setpoint too high.	Reduce alarm set point. Factory default setting is 92 percent. Press and hold Singulation button for 4 seconds to go to Alarms and Limits Setup Screen. Enter "0" to turn off singulation alarm.
Seed Spacing Coefficient of Variation (CV) percentage high.	Excessive ground speed.	Increase row unit down force first. If singulation does not improve, reduce ground speed.
	Excessive row unit dynamics (bounce).	Increase row unit down force first. If singulation does not improve, reduce ground speed.
	Erratic Driveline Operation.	Check meter drive line. Check chains, bearings, drill shaft bearings, drill shaft couplers for proper alignment, lubrication, and smooth operation. Refer to planter operator's manual.

Troubleshooting

Symptom	Problem	Solution
	Meter not adjusted properly.	Refer to Rate Charts and Settings Manual. Confirm correct disk type and vacuum level for seed being used. Confirm brush type and meter hub adjustment. Confirm correct talc usage and mixing. Check and adjust double eliminator setting (if used).
	Alarm set point too low.	Increase alarm set point. Factory default setting is 0.35. Press and hold Seed Spacing CV button for 4 seconds to go to Alarms and Limits Setup Screen. Enter "0" to turn off Seed Spacing alarm.
Down force margin too low.	Pneumatic down force setting exceeds frame or wing weight and cause planter frame to "float".	Reduce down force setting if possible. See your John Deere dealer for frame ballast options.
	Target margin set point too high for planting conditions.	Reduce target margin set point. Press and hold any SeedStar™ XP button for 4 seconds to access Alarms and Limits Setup Screen.
Down force margin too high.	Pneumatic down force setting too high for planting conditions.	Reduce pneumatic down force setting.
	Target margin set point too low for planting conditions.	Increase target margin set point.
	Row unit weight exceeds down force margin requirement.	Install up force springs to reduce row unit down force.

OUO6064,0000651 -19-10NOV11-2/2

Troubleshoot Single Set-Point Pneumatic Down Force System

Symptom	Problem	Solution
Compressor does not run.	Blown Fuse.	Check and replace tractor convenience outlet fuse and compressor battery power harness fuse (if used).
	No electrical power at compressor.	Inspect compressor wiring harness and battery harness (if used) and connectors for damage. Repair or replace as required.
	Bad pressure switch.	Remove all air pressure from air storage tank. Unplug pressure switch. Check continuity across switch wires. If no continuity, replace switch.
	Bad relay.	Replace relay.
Row unit down force does not increase or decrease.	Increase or decrease solenoid valve stuck closed.	Actuate manual override for increase or decrease solenoid valve several times. Remove all air pressure from system. Clean or replace solenoid valves. Shop air and tire pressure gauge can be used to adjust air pressure in air spring circuit manually until problem can be fixed.
	Open circuit on solenoid wires (caution screen appears on GreenStar™ display and diagnostic trouble code is set).	Check and repair wiring harness.
	Open circuit within solenoid (caution screen appears on GreenStar™ display and diagnostic trouble code is set).	Check continuity of solenoid coil. Replace solenoid.
Air spring circuit relief valve opens.	Increase solenoid valve stuck open.	Actuate manual override for increase solenoid valve several times. Relieve all pressure from system. Clean or replace solenoid valve.
	Weak relief valve spring.	Replace relief valve.
Tank circuit relief valve opens.	Pressure switch stuck ON.	Turn tractor key switch OFF. With pressure in tank, unplug pressure switch connector. Check continuity across switch wires. If there is continuity, replace switch.
Incorrect down force reading displayed on monitor.	Pressure sensor not calibrated.	Calibrate sensor. Refer to INTEGRATED PNEUMATIC DOWN FORCE AIR PRESSURE SENSOR in SeedStar™ 2 SETUP Basic Planter Configuration section.

Troubleshooting

Symptom	Problem	Solution
Pneumatic Down Force solenoid circuit error.	PM2 controller has detected an open circuit or short circuit in the pneumatic downforce increase or decrease solenoid circuit.	Check wiring harness and electrical connectors from PM2 controller to pneumatic downforce solenoids. Check continuity of solenoid coils.
Incorrect down force margin reading displayed on monitor.	Gauge wheel sensor not calibrated.	Raise planter to remove load and zero all sensors.
	Gauge wheel arms binding	Grease gauge wheel arm pivots.
		Replace worn parts if binding occurs.

OUO6064,00005DE -19-10NOV11-2/2

Troubleshoot Dual Set-Point and Active Pneumatic Down Force System

Symptom	Problem	Solution
Compressor does not run.	No hydraulic pressure or flow.	Tractor raise/lower hydraulic circuit must be in the continuous retract detent position.
	Planter raised	Planter must be lowered in plant position.
	Row unit height switch not functioning.	Properly adjust row unit height switch. Verify wiring harness connections to row unit height switch.
	Hydraulic motor solenoid valve not functioning.	Verify hydraulic motor solenoid electrical connection. Check and repair solenoid wiring harness. Check continuity of solenoid coil. Replace coil.
	Bad pressure switch.	Remove all air pressure from air storage tank. Unplug pressure switch. Check continuity across switch wires. If no continuity, replace switch.
Row unit down force does not increase or decrease.	Increase or decrease solenoid valve stuck closed.	Actuate manual override for increase or decrease solenoid valve several times. Remove all air pressure from system. Clean or replace solenoid valves. Shop air and tire pressure gauge can be used to adjust air pressure in air spring circuit manually until problem can be fixed.
	Open circuit on solenoid wires (caution screen appears on GreenStar™ display and diagnostic trouble code is set).	Check and repair wiring harness.
	Open circuit within solenoid (caution screen appears on GreenStar™ display and diagnostic trouble code is set).	Check continuity of solenoid coil. Replace solenoid.
Air spring circuit relief valve opens.	Increase solenoid valve stuck open.	Actuate manual override for increase solenoid valve several times. Relieve all pressure from system. Clean or replace solenoid valve.
	Weak relief valve spring.	Replace relief valve.

Troubleshoot Variable Rate Fertilizer

Symptom	Problem	Solution
WARNING Screen: Pump Motor Drive Power is not detected. Turn off all power. Connect the 7-pin connector. Restart.	Power lost to motor.	Ensure 7-pin connector is plugged into tractor.
	Loose connector or pin.	Check 7-pin connector for proper voltage and inspect pins. See your John Deere dealer.
	Pinched wires in harness.	Inspect harness for damage. See your John Deere dealer.
	Blown fuse.	Check tractor fuses.
WARNING Screen: Pump # Position Sensor not detected. Unable to adjust rate/ calculated rate goes to zero.	Pump position sensor harness lead has an open or short.	Inspect position sensor leads for damage and proper connection.
		Check position sensor circuit on wiring harness. See your John Deere dealer for sensor diagnostics.
Unable to adjust rate. Calculated rate goes to zero.	Pump RPM sensor harness has an open or short.	Inspect pump RPM sensor leads for damage and proper connection.
		Check pump RPM sensor lead wiring harness. See your John Deere dealer.
WARNING Screen: Pump # No Response to Control Command. Unable to adjust rate.	Pump position sensor harness has an open or short.	Check pump position sensor leads for damage and proper connection.
		Check pump position sensor circuit on wiring harness. See your John Deere dealer.
	Loose set screw on sensor.	Check motor set screw for tightness.
	Motor does not turn.	See your John Deere dealer for motor diagnostics.
		Check motor wiring harness for damage.
GreenStar™ display shows "Controller Disconnected".	Signal lost after power up.	Perform CAN diagnostics. See your John Deere dealer.
WARNING Screen: All Devices Unable to Communicate.	CAN signal lead short to power or ground.	Perform CAN diagnostics. See John Deere dealer.
Motor does not adjust or blown fuse.	Pinched wires.	Inspect for pinched wires and repair.
	Damaged connector pin.	Inspect connector pins and repair.

Troubleshooting

Symptom	Problem	Solution
WARNING Screen: Over Application. WARNING Screen: Under Application. WARNING Screen: V.R. Fert System Problem. Calculated rates may not be accurate.	Stretched wires due to improper routing.	Inspect for damaged wires and repair.
	Small rate sprocket used on pump.	Use large sprocket.
	Large rate sprocket used on pump.	Use small sprocket.
	Drive wheel slippage.	Increase pressure in variable rate fertilizer pneumatic contact wheel spring.
	Incorrect RPM sensor signal.	Adjust sensor for correct gap. If gap is correct, replace sensor.

OUO6074,000106F -19-13MAR09-2/2

Storage

Beginning of the Season Service

Before using the monitor after it has been stored, inspect for cleanliness and damage.

Thoroughly inspect monitor display, controller wedgebox, harnesses, radar and sensors for loose parts and adjust as necessary.

Clean any dirt or grease that may have accumulated before operating.

AG,OUO1074,1591 -19-12MAY04-1/1

Liquid Fertilizer Sensor

Remove sensor and flush with clean water.

Do not insert any object or tool into fluid port.

A37524 —UN—13SEP95

AG,OUO1074,1592 -19-24APR00-1/1

Vacuum Sensor

NOTE: P2 port (A) used for hose connection.

Protect when using water to wash planter.

A—P2 Port

A40613 —UN—30DEC96

AG,OUO1074,1593 -19-24APR00-1/1

Pneumatic Down Force Air Spring Storage Procedures

When Storing Machine

IMPORTANT: Do not remove air from system. Air spring must be pressurized and allowed to leak down slowly to 0 psi.

- Park machine with 11 kg (25 lb.) of down force displayed on monitor or approximately 55 kPa (0.5 bar) (8 psi) on gauge.

When removing from storage:

CAUTION: Avoid serious injury from exploding parts due to over-pressurization or operating the system without all components in place.

Do not inflate system above 827 kPa (8.2 bar) (120 psi).

Do not remove pressure relief valve.

Do not pressurize system unless all row unit components are in place.

IMPORTANT: Do not operate if a pinched or unrolled air spring occurs. Lower system pressure until air spring can be rolled by hand. Roll air spring back over lower piston. Incremental lowering of machine is required to start air spring rolling over lower piston.

When Removing Machine From Storage

- To fill the planters down force air springs for the first time after removing from storage:
 - In Auto mode, system begins filling the air springs to achieve the target margin when lowered to planting position.
 - In Set-Point mode, system begins filling the air springs to achieve the target down force when lowered to planting position.
- Pressurize system to a minimum of 16 kg (35 lb.) of down force displayed on monitor or approximately 83 kPa (0.8 bar) (12 psi) on gauge.
- Minimum down force during operation is 16 kg (35 lb.) displayed on monitor or approximately 103 kPa (1.0 bar) (15 psi) on gauge. Failure to maintain this pressure can result in damage to air springs.

Properly Rolled Air Spring

Properly Rolled Air Spring (Twin Row)

Improperly Rolled Air Spring

Improperly Rolled Air Spring (Twin Row)
